

quence listing part.

[42327] VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42328] VGAM3026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3026 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3026 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42329] The complementary binding of VGAM3026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3026 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42330] It is appreciated that VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3026 host target genes. The mRNA of each one of this plurality of VGAM3026 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3026 RNA, herein designated VGAM RNA, and which when bound by VGAM3026 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3026 host target proteins.

[42331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3026 gene, herein designated VGAM GENE, on one or more VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42332] It is yet further appreciated that a function of VGAM3026

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3026 include diagnosis, prevention and treatment of viral infection by Satellite virus of maize white line mosaic virus. Specific functions, and accordingly utilities, of VGAM3026 correlate with, and may be deduced from, the identity of the host target genes which VGAM3026 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42333] Nucleotide sequences of the VGAM3026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3026 are further described hereinbelow with reference to Table 1.

[42334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42335] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3027 (VGAM3027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42336] VGAM3027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3027 was detected is described hereinabove with reference to Figs. 2–8.

[42337] VGAM3027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satellite virus of maize white line mosaic virus. VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42338] VGAM3027 gene, herein designated VGAM GENE, encodes a VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3027 precursor RNA is designated SEQ ID:69151, and is provided

hereinbelow with reference to the sequence listing part.

[42339] VGAM3027 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42340] An enzyme complex designated DICER COMPLEX, dices the VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3027 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3027 RNA is designated SEQ ID:69152, and is provided hereinbelow with reference to the sequence listing part.

[42341] VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42342] VGAM3027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3027 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3027 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42343] The complementary binding of VGAM3027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42344] It is appreciated that VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3027 host target genes. The mRNA of each one of this plurality of VGAM3027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3027 RNA, herein designated VGAM RNA, and which when bound by VGAM3027 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3027 host target proteins.

[42345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3027 gene, herein designated VGAM GENE, on one or more VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42346] It is yet further appreciated that a function of VGAM3027 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3027 include diagnosis, prevention and treatment of viral infection by Satellite virus of maize white line mosaic virus. Specific functions, and accordingly utilities, of VGAM3027 correlate with, and may be deduced from, the identity of the host target genes which VGAM3027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42347] Nucleotide sequences of the VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3027 are further described hereinbelow with reference to Table 1.

[42348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42349] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3028 (VGAM3028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42350] VGAM3028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3028 was detected is described hereinabove with reference to Figs. 2–8.

[42351] VGAM3028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM3028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42352] VGAM3028 gene, herein designated VGAM GENE, encodes a VGAM3028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3028 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3028 precursor RNA is designated SEQ ID:69192, and is provided hereinbelow with reference to the sequence listing part.

[42353] VGAM3028 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42354] An enzyme complex designated DICER COMPLEX, dices the VGAM3028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3028 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3028 RNA is designated SEQ ID:69193, and is provided hereinbelow with reference to the sequence listing part.

[42355] VGAM3028 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42356] VGAM3028 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3028 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3028 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42357] The complementary binding of VGAM3028 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3028 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3028 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42358] It is appreciated that VGAM3028 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3028 host target genes. The mRNA of each one of this plurality of VGAM3028 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3028 RNA, herein designated VGAM

RNA, and which when bound by VGAM3028 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3028 host target proteins.

[42359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3028 gene, herein designated VGAM GENE, on one or more VGAM3028 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42360] It is yet further appreciated that a function of VGAM3028 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3028 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3028 correlate with, and may be deduced from, the identity of the host target genes which VGAM3028 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42361] Nucleotide sequences of the VGAM3028 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3028 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3028 are further described hereinbelow with reference to Table 1.

[42362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3028 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42363] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3029 (VGAM3029) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42364] VGAM3029 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3029 was detected is described hereinabove with reference to Figs. 2–8.

[42365] VGAM3029 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM3029 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42366] VGAM3029 gene, herein designated VGAM GENE, encodes a VGAM3029 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3029 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3029 precursor RNA is designated SEQ ID:69205, and is provided hereinbelow with reference to the sequence listing part.

[42367] VGAM3029 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42368] An enzyme complex designated DICER COMPLEX, dices the VGAM3029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3029 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3029 RNA is designated SEQ ID:69206, and is provided hereinbelow with reference to the sequence listing part.

[42369] VGAM3029 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3029 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3029 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42370] VGAM3029 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3029 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3029 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3029 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3029 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42371] The complementary binding of VGAM3029 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3029 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3029 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3029 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42372] It is appreciated that VGAM3029 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3029 host target genes. The mRNA of each one of this plurality of VGAM3029 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3029 RNA, herein designated VGAM RNA, and which when bound by VGAM3029 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3029 host target proteins.

[42373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3029 gene, herein designated VGAM GENE, on one or more VGAM3029 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42374] It is yet further appreciated that a function of VGAM3029 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3029 include diagnosis, prevention and

treatment of viral infection by Saimiriine herpesvirus 2.

Specific functions, and accordingly utilities, of VGAM3029 correlate with, and may be deduced from, the identity of the host target genes which VGAM3029 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42375] Nucleotide sequences of the VGAM3029 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3029 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3029 are further described hereinbelow with reference to Table 1.

[42376] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3029 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42377] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3030 (VGAM3030) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42378] VGAM3030 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3030 was detected is described hereinabove with reference to Figs. 2–8.

[42379] VGAM3030 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM3030 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42380] VGAM3030 gene, herein designated VGAM GENE, encodes a VGAM3030 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3030 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3030 precursor RNA is designated SEQ ID:69213, and is provided hereinbelow with reference to the sequence listing part.

[42381] VGAM3030 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3030 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42382] An enzyme complex designated DICER COMPLEX, dices the VGAM3030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3030 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3030 RNA is designated SEQ ID:69214, and is provided hereinbelow with reference to the sequence listing part.

[42383] VGAM3030 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3030 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3030 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42384] VGAM3030 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3030 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3030 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3030 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3030 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42385] The complementary binding of VGAM3030 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3030 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3030 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3030 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42386] It is appreciated that VGAM3030 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3030 host target genes. The mRNA of each one of this plurality of VGAM3030 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3030 RNA, herein designated VGAM RNA, and which when bound by VGAM3030 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3030 host target proteins.

[42387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3030 gene, herein designated VGAM GENE, on one or more VGAM3030 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42388] It is yet further appreciated that a function of VGAM3030 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3030 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2.

Specific functions, and accordingly utilities, of VGAM3030 correlate with, and may be deduced from, the identity of the host target genes which VGAM3030 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42389] Nucleotide sequences of the VGAM3030 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3030 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3030 are further described hereinbelow with reference to Table 1.

[42390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3030 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42391] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3031 (VGAM3031) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[42392] VGAM3031 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3031 was detected is described hereinabove with reference to Figs. 2–8.

[42393] VGAM3031 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3031 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42394] VGAM3031 gene, herein designated VGAM GENE, encodes a VGAM3031 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3031 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3031 precursor RNA is designated SEQ ID:69218, and is provided hereinbelow with reference to the sequence listing part.

[42395] VGAM3031 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3031 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42396] An enzyme complex designated DICER COMPLEX, dices the VGAM3031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3031 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3031 RNA is designated SEQ ID:69219, and is provided hereinbelow with reference to the sequence listing part.

[42397] VGAM3031 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3031 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3031 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42398] VGAM3031 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3031 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3031 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3031 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3031 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42399] The complementary binding of VGAM3031 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3031 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3031 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3031 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42400] It is appreciated that VGAM3031 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3031 host target genes. The mRNA of each one of this plurality of VGAM3031 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3031 RNA, herein designated VGAM RNA, and which when bound by VGAM3031 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3031 host target proteins.

[42401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3031 gene, herein designated VGAM GENE, on one or more VGAM3031 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42402] It is yet further appreciated that a function of VGAM3031 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3031 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of

VGAM3031 correlate with, and may be deduced from, the identity of the host target genes which VGAM3031 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42403] Nucleotide sequences of the VGAM3031 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3031 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3031 are further described hereinbelow with reference to Table 1.

[42404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3031 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42405] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3032 (VGAM3032) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[42406] VGAM3032 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3032 was detected is described hereinabove with reference to Figs. 2–8.

[42407] VGAM3032 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3032 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42408] VGAM3032 gene, herein designated VGAM GENE, encodes a VGAM3032 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3032 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3032 precursor RNA is designated SEQ ID:69226, and is provided hereinbelow with reference to the sequence listing part.

[42409] VGAM3032 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42410] An enzyme complex designated DICER COMPLEX, dices the VGAM3032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3032 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3032 RNA is designated SEQ ID:69227, and is provided hereinbelow with reference to the sequence listing part.

[42411] VGAM3032 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42412] VGAM3032 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3032 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3032 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42413] The complementary binding of VGAM3032 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3032 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3032 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42414] It is appreciated that VGAM3032 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3032 host target genes. The mRNA of each one of this plurality of VGAM3032 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3032 RNA, herein designated VGAM RNA, and which when bound by VGAM3032 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3032 host target proteins.

[42415] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3032 gene, herein designated VGAM GENE, on one or more VGAM3032 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42416] It is yet further appreciated that a function of VGAM3032 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3032 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3032 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3032 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42417] Nucleotide sequences of the VGAM3032 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3032 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3032 are further described hereinbelow with reference to Table 1.

[42418] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3032 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42419] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3033 (VGAM3033) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42420] VGAM3033 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3033 was detected is described hereinabove with reference to Figs. 2–8.

[42421] VGAM3033 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3033 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42422] VGAM3033 gene, herein designated VGAM GENE, encodes a VGAM3033 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3033 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3033 precursor RNA is designated SEQ ID:69231, and is provided hereinbelow with reference to the sequence listing part.

[42423] VGAM3033 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42424] An enzyme complex designated DICER COMPLEX, dices the VGAM3033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3033 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3033 RNA is designated SEQ ID:69232, and is provided hereinbelow with reference to the sequence listing part.

[42425] VGAM3033 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42426] VGAM3033 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3033 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3033 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42427] The complementary binding of VGAM3033 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3033 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3033 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42428] It is appreciated that VGAM3033 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3033 host target genes. The mRNA of each one of this plurality of VGAM3033 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3033 RNA, herein designated VGAM RNA, and which when bound by VGAM3033 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3033 host target proteins.

[42429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3033 gene, herein designated VGAM GENE, on one or more VGAM3033 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42430] It is yet further appreciated that a function of VGAM3033 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3033 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3033 correlate with, and may be deduced from, the identity of the host target genes which VGAM3033 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[42431] Nucleotide sequences of the VGAM3033 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3033 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3033 are further described hereinbelow with reference to Table 1.

[42432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3033 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42433] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3034 (VGAM3034) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42434] VGAM3034 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3034 was detected is described hereinabove with reference to Figs. 2–8.

[42435] VGAM3034 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human erythrovirus V9. VGAM3034 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42436] VGAM3034 gene, herein designated VGAM GENE, encodes a VGAM3034 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3034 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3034 precursor RNA is designated SEQ ID:69244, and is provided hereinbelow with reference to the sequence listing part.

[42437] VGAM3034 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42438] An enzyme complex designated DICER COMPLEX, dices the VGAM3034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3034 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3034 RNA is designated SEQ ID:69245, and is provided hereinbelow with reference to the sequence listing part.

[42439] VGAM3034 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42440] VGAM3034 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3034 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3034 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[42441] The complementary binding of VGAM3034 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3034 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3034 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42442] It is appreciated that VGAM3034 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3034 host target genes. The mRNA of each one of this plurality of VGAM3034 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3034 RNA, herein designated VGAM RNA, and which when bound by VGAM3034 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3034 host target proteins.

[42443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3034 gene, herein designated VGAM GENE, on one or more VGAM3034 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42444] It is yet further appreciated that a function of VGAM3034 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3034 include diagnosis, prevention and treatment of viral infection by Human erythrovirus V9. Specific functions, and accordingly utilities, of VGAM3034 correlate with, and may be deduced from, the identity of the host target genes which VGAM3034 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[42445] Nucleotide sequences of the VGAM3034 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3034 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3034 are further described hereinbelow with reference to Table 1.

[42446] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3034 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42447] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3035 (VGAM3035) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42448] VGAM3035 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3035 was detected is described hereinabove with reference to Figs. 2–8.

[42449] VGAM3035 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bombyx mori densovirus 1. VGAM3035 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42450] VGAM3035 gene, herein designated VGAM GENE, encodes a VGAM3035 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3035 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3035 precursor RNA is designated SEQ ID:69256, and is provided hereinbelow with reference to the sequence listing part.

[42451] VGAM3035 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42452] An enzyme complex designated DICER COMPLEX, dices the VGAM3035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3035 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3035 RNA is designated SEQ ID:69257, and is provided hereinbelow with reference to the sequence listing part.

[42453] VGAM3035 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[42454] VGAM3035 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3035 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3035 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42455] The complementary binding of VGAM3035 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3035 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3035 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42456] It is appreciated that VGAM3035 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3035 host target genes. The mRNA of each one of this plurality of VGAM3035 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3035 RNA, herein designated VGAM RNA, and which when bound by VGAM3035 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3035 host target proteins.

[42457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3035 gene, herein designated VGAM GENE, on one

or more VGAM3035 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42458] It is yet further appreciated that a function of VGAM3035 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3035 include diagnosis, prevention and treatment of viral infection by Bombyx mori densovirus 1. Specific functions, and accordingly utilities, of VGAM3035 correlate with, and may be deduced from, the identity of the host target genes which VGAM3035 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42459] Nucleotide sequences of the VGAM3035 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3035 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3035 are further described hereinbelow with reference to Table 1.

[42460] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3035 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42461] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3036 (VGAM3036) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42462] VGAM3036 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3036 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[42463] VGAM3036 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3036 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42464] VGAM3036 gene, herein designated VGAM GENE, encodes a VGAM3036 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3036 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3036 precursor RNA is designated SEQ ID:69271, and is provided hereinbelow with reference to the sequence listing part.

[42465] VGAM3036 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42466] An enzyme complex designated DICER COMPLEX, dices the VGAM3036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3036 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3036 RNA is designated SEQ ID:69272, and is provided hereinbelow with reference to the sequence listing part.

[42467] VGAM3036 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42468] VGAM3036 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3036 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3036 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42469] The complementary binding of VGAM3036 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3036 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3036 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42470] It is appreciated that VGAM3036 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3036 host target genes. The mRNA of each one of this plurality of VGAM3036 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3036 RNA, herein designated VGAM RNA, and which when bound by VGAM3036 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3036 host target proteins.

[42471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3036 gene, herein designated VGAM GENE, on one or more VGAM3036 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42472] It is yet further appreciated that a function of VGAM3036 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3036 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3036 correlate with, and may be deduced from, the identity of the host target genes which VGAM3036 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42473] Nucleotide sequences of the VGAM3036 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3036 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3036 are further described hereinbelow with reference to Table 1.

[42474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3036 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42475] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3037 (VGAM3037) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42476] VGAM3037 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3037 was detected is described hereinabove with reference to Figs. 2-8.

[42477] VGAM3037 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3037 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42478] VGAM3037 gene, herein designated VGAM GENE, encodes a VGAM3037 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3037 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3037 precursor RNA is designated SEQ ID:69277, and is provided hereinbelow with reference to the sequence listing part.

[42479] VGAM3037 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[42480] An enzyme complex designated DICER COMPLEX, dices the VGAM3037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3037 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3037 RNA is designated SEQ ID:69278, and is provided hereinbelow with reference to the sequence listing part.

[42481] VGAM3037 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42482] VGAM3037 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3037 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3037 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42483] The complementary binding of VGAM3037 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3037 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3037 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42484] It is appreciated that VGAM3037 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3037 host target genes. The mRNA of each one of this plurality of VGAM3037 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3037 RNA, herein designated VGAM RNA, and which when bound by VGAM3037 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3037 host target proteins.

[42485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3037 gene, herein designated VGAM GENE, on one or more VGAM3037 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42486] It is yet further appreciated that a function of VGAM3037 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3037 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3037 correlate with, and may be deduced from, the identity of the host target genes which VGAM3037 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42487] Nucleotide sequences of the VGAM3037 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3037 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3037 are further described hereinbelow with reference to Table 1.

[42488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3037 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42489] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3038 (VGAM3038) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42490] VGAM3038 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3038 was detected is described hereinabove with reference to Figs. 2-8.

[42491] VGAM3038 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpox virus.

VGAM3038 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42492] VGAM3038 gene, herein designated VGAM GENE, encodes a VGAM3038 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3038 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3038 precursor RNA is designated SEQ ID:69291, and is provided hereinbelow with reference to the sequence listing part.

[42493] VGAM3038 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42494] An enzyme complex designated DICER COMPLEX, dices the VGAM3038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3038 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3038 RNA is designated SEQ ID:69292, and is provided hereinbelow with reference to the sequence listing part.

[42495] VGAM3038 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3038 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3038 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42496] VGAM3038 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3038 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3038 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3038 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3038 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42497] The complementary binding of VGAM3038 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3038 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3038 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3038 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42498] It is appreciated that VGAM3038 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3038 host target genes. The mRNA of each one of this plurality of VGAM3038 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3038 RNA, herein designated VGAM RNA, and which when bound by VGAM3038 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3038 host target proteins.

[42499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3038 gene, herein designated VGAM GENE, on one or more VGAM3038 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42500] It is yet further appreciated that a function of VGAM3038 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3038 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3038 correlate with, and may be deduced from, the identity of the host target genes which VGAM3038 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42501] Nucleotide sequences of the VGAM3038 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3038 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3038 are further described hereinbelow with reference to Table 1.

[42502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3038 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42503] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3039 (VGAM3039) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42504] VGAM3039 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3039 was detected is described hereinabove with reference to Figs. 2-8.

[42505] VGAM3039 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7.

VGAM3039 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42506] VGAM3039 gene, herein designated VGAM GENE, encodes a VGAM3039 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3039 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3039 precursor RNA is designated SEQ ID:69324, and is provided hereinbelow with reference to the sequence listing part.

[42507] VGAM3039 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42508] An enzyme complex designated DICER COMPLEX, dices

the VGAM3039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3039 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3039 RNA is designated SEQ ID:69325, and is provided hereinbelow with reference to the sequence listing part.

[42509] VGAM3039 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3039 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3039 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42510] VGAM3039 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3039 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3039 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3039 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3039 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42511] The complementary binding of VGAM3039 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3039 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3039 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3039 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42512] It is appreciated that VGAM3039 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3039 host target genes. The mRNA of each one of this plurality of VGAM3039 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3039 RNA, herein designated VGAM RNA, and which when bound by VGAM3039 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3039 host target proteins.

[42513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3039 gene, herein designated VGAM GENE, on one or more VGAM3039 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42514] It is yet further appreciated that a function of VGAM3039 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3039 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3039 correlate with, and may be deduced from, the identity of the host target genes which VGAM3039 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42515] Nucleotide sequences of the VGAM3039 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3039 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3039 are further described hereinbelow with reference to Table 1.

[42516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3039 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42517] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3040 (VGAM3040) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42518] VGAM3040 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3040 was detected is described hereinabove with reference to Figs. 2-8.

[42519] VGAM3040 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3040 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42520] VGAM3040 gene, herein designated VGAM GENE, encodes a VGAM3040 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3040 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3040 precursor RNA is designated SEQ ID:69329, and is provided hereinbelow with reference to the sequence listing part.

[42521] VGAM3040 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42522] An enzyme complex designated DICER COMPLEX, dices the VGAM3040 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3040 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3040 RNA is designated SEQ ID:69330, and is provided hereinbelow with reference to the sequence listing part.

[42523] VGAM3040 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3040 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3040 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42524] VGAM3040 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3040 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3040 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3040 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3040 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42525] The complementary binding of VGAM3040 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3040 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3040

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3040 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42526] It is appreciated that VGAM3040 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3040 host target genes. The mRNA of each one of this plurality of VGAM3040 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3040 RNA, herein designated VGAM RNA, and which when bound by VGAM3040 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3040 host target proteins.

[42527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3040 gene, herein designated VGAM GENE, on one or more VGAM3040 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42528] It is yet further appreciated that a function of VGAM3040 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3040 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3040 correlate with, and may be deduced from, the identity of the host target genes which VGAM3040 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42529] Nucleotide sequences of the VGAM3040 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3040 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3040 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3040 are further described hereinbelow with reference to Table 1.

[42530] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3040 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42531] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3041 (VGAM3041) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42532] VGAM3041 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3041 was detected is described hereinabove with reference to Figs. 2-8.

[42533] VGAM3041 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine papillomavirus type 2. VGAM3041 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[42534] VGAM3041 gene, herein designated VGAM GENE, encodes a VGAM3041 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3041 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3041 precursor RNA is designated SEQ ID:69334, and is provided hereinbelow with reference to the sequence listing part.

[42535] VGAM3041 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42536] An enzyme complex designated DICER COMPLEX, dices the VGAM3041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3041 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3041 RNA is designated SEQ ID:69335, and is provided hereinbelow with reference to the sequence listing part.

[42537] VGAM3041 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3041 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3041 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42538] VGAM3041 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3041 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3041 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3041 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3041 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42539] The complementary binding of VGAM3041 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3041 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3041 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3041 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42540] It is appreciated that VGAM3041 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3041 host target genes. The mRNA of each one of this plurality of VGAM3041 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3041 RNA, herein designated VGAM RNA, and which when bound by VGAM3041 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3041 host target proteins.

[42541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3041 gene, herein designated VGAM GENE, on one or more VGAM3041 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42542] It is yet further appreciated that a function of VGAM3041 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3041 include diagnosis, prevention and treatment of viral infection by Bovine papillomavirus type 2. Specific functions, and accordingly utilities, of VGAM3041 correlate with, and may be deduced from, the identity of the host target genes which VGAM3041 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42543] Nucleotide sequences of the VGAM3041 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3041 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3041 are further

described hereinbelow with reference to Table 1.

[42544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3041 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42545] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3042 (VGAM3042) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42546] VGAM3042 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3042 was detected is described hereinabove with reference to Figs. 2-8.

[42547] VGAM3042 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bombyx mori densovirus 5. VGAM3042 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42548] VGAM3042 gene, herein designated VGAM GENE, encodes a VGAM3042 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3042 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3042 precursor RNA is designated SEQ ID:69361, and is provided hereinbelow with reference to the sequence listing part.

[42549] VGAM3042 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42550] An enzyme complex designated DICER COMPLEX, dices the VGAM3042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3042 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3042 RNA is designated SEQ ID:69362, and is provided hereinbelow with reference to the sequence listing part.

[42551] VGAM3042 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42552] VGAM3042 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3042 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3042 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42553] The complementary binding of VGAM3042 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3042 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3042 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42554] It is appreciated that VGAM3042 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3042 host target genes. The mRNA of each one of this plurality of VGAM3042 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3042 RNA, herein designated VGAM RNA, and which when bound by VGAM3042 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3042 host target proteins.

[42555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3042 gene, herein designated VGAM GENE, on one or more VGAM3042 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42556] It is yet further appreciated that a function of VGAM3042 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3042 include diagnosis, prevention and treatment of viral infection by Bombyx mori densovirus 5. Specific functions, and accordingly utilities, of VGAM3042 correlate with, and may be deduced from, the identity of the host target genes which VGAM3042 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42557] Nucleotide sequences of the VGAM3042 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3042 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3042 are further described hereinbelow with reference to Table 1.

[42558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3042 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42559] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3043 (VGAM3043) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42560] VGAM3043 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3043 was detected is described hereinabove with reference to Figs. 2-8.

[42561] VGAM3043 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human immunodeficiency virus 1. VGAM3043 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42562] VGAM3043 gene, herein designated VGAM GENE, encodes

a VGAM3043 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3043 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3043 precursor RNA is designated SEQ ID:69366, and is provided hereinbelow with reference to the sequence listing part.

[42563] VGAM3043 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42564] An enzyme complex designated DICER COMPLEX, dices the VGAM3043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3043 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3043 RNA is designated SEQ ID:69367, and is provided hereinbelow with reference to the sequence listing part.

[42565] VGAM3043 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42566] VGAM3043 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3043 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3043 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42567] The complementary binding of VGAM3043 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3043 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3043 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[42568] It is appreciated that VGAM3043 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3043 host target genes. The mRNA of each one of this plurality of VGAM3043 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3043 RNA, herein designated VGAM RNA, and which when bound by VGAM3043 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3043 host target proteins.

[42569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3043 gene, herein designated VGAM GENE, on one or more VGAM3043 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42570] It is yet further appreciated that a function of VGAM3043 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3043 include diagnosis, prevention and treatment of viral infection by Human immunodeficiency virus 1. Specific functions, and accordingly utilities, of VGAM3043 correlate with, and may be deduced from, the identity of the host target genes which VGAM3043 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42571] Nucleotide sequences of the VGAM3043 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3043 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3043 are further described hereinbelow with reference to Table 1.

[42572] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3043 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42573] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3044 (VGAM3044) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42574] VGAM3044 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3044 was detected is described hereinabove with reference to Figs. 2-8.

[42575] VGAM3044 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhesus monkey papillomavirus. VGAM3044 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42576] VGAM3044 gene, herein designated VGAM GENE, encodes a VGAM3044 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3044 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3044 precursor RNA is designated SEQ ID:69388, and is provided hereinbelow with reference to the sequence listing part.

[42577] VGAM3044 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42578] An enzyme complex designated DICER COMPLEX, dices the VGAM3044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3044 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3044 RNA is designated SEQ ID:69389, and is provided hereinbelow with reference to the sequence listing part.

[42579] VGAM3044 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42580] VGAM3044 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3044 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3044 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42581] The complementary binding of VGAM3044 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3044 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3044 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42582] It is appreciated that VGAM3044 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3044 host target genes. The mRNA of each one of this plurality of VGAM3044 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3044 RNA, herein designated VGAM RNA, and which when bound by VGAM3044 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3044 host target proteins.

[42583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3044 gene, herein designated VGAM GENE, on one or more VGAM3044 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42584] It is yet further appreciated that a function of VGAM3044 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3044 include diagnosis, prevention and treatment of viral infection by Rhesus monkey papillomavirus. Specific functions, and accordingly utilities, of VGAM3044 correlate with, and may be deduced from, the identity of the host target genes which VGAM3044 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42585] Nucleotide sequences of the VGAM3044 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3044 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3044 are further described hereinbelow with reference to Table 1.

[42586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3044 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42587] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3045 (VGAM3045) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42588] VGAM3045 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3045 was detected is described hereinabove with reference to Figs. 2-8.

[42589] VGAM3045 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bombyx mori densovirus 1. VGAM3045 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42590] VGAM3045 gene, herein designated VGAM GENE, encodes a VGAM3045 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3045 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3045 precursor RNA is designated SEQ ID:69407, and is provided hereinbelow with reference to the sequence listing part.

[42591] VGAM3045 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42592] An enzyme complex designated DICER COMPLEX, dices the VGAM3045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3045 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3045 RNA is designated SEQ ID:69408, and is provided hereinbelow with reference to the sequence listing part.

[42593] VGAM3045 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42594] VGAM3045 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3045 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3045 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42595] The complementary binding of VGAM3045 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3045 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3045 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42596] It is appreciated that VGAM3045 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3045 host target genes. The mRNA of each one of this plurality of VGAM3045 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3045 RNA, herein designated VGAM RNA, and which when bound by VGAM3045 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3045 host target proteins.

[42597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3045 gene, herein designated VGAM GENE, on one or more VGAM3045 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42598] It is yet further appreciated that a function of VGAM3045 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3045 include diagnosis, prevention and treatment of viral infection by Bombyx mori densovirus 1. Specific functions, and accordingly utilities, of VGAM3045 correlate with, and may be deduced from, the identity of the host target genes which VGAM3045 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42599] Nucleotide sequences of the VGAM3045 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3045 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3045 are further described hereinbelow with reference to Table 1.

[42600] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3045 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42601] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3046 (VGAM3046) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42602] VGAM3046 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3046 was detected is described hereinabove with reference to Figs. 2–8.

[42603] VGAM3046 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3046 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42604] VGAM3046 gene, herein designated VGAM GENE, encodes a VGAM3046 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3046 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3046 precursor RNA is designated SEQ ID:69412, and is provided hereinbelow with reference to the sequence listing part.

[42605] VGAM3046 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42606] An enzyme complex designated DICER COMPLEX, dices the VGAM3046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3046 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3046 RNA is designated SEQ ID:69413, and is provided hereinbelow with reference to the sequence listing part.

[42607] VGAM3046 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42608] VGAM3046 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3046 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3046 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42609] The complementary binding of VGAM3046 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3046 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3046 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42610] It is appreciated that VGAM3046 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3046 host target genes. The mRNA of each one of this plurality of VGAM3046 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3046 RNA, herein designated VGAM RNA, and which when bound by VGAM3046 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3046 host target proteins.

[42611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3046 gene, herein designated VGAM GENE, on one or more VGAM3046 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [42612] It is yet further appreciated that a function of VGAM3046 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3046 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3046 correlate with, and may be deduced from, the identity of the host target genes which VGAM3046 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [42613] Nucleotide sequences of the VGAM3046 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3046 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3046 are further described hereinbelow with reference to Table 1.
- [42614] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3046 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42615] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3047 (VGAM3047) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42616] VGAM3047 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3047 was detected is described hereinabove with reference to Figs. 2-8.

[42617] VGAM3047 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Horseradish curly top virus. VGAM3047 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42618] VGAM3047 gene, herein designated VGAM GENE, encodes a VGAM3047 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3047 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3047 precursor RNA is designated SEQ ID:69438, and is provided hereinbelow with reference to the sequence listing part.

[42619] VGAM3047 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42620] An enzyme complex designated DICER COMPLEX, dices the VGAM3047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3047 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3047 RNA is designated SEQ ID:69439, and is provided hereinbelow with reference to the sequence listing part.

[42621] VGAM3047 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42622] VGAM3047 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3047 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3047 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42623] The complementary binding of VGAM3047 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3047 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3047 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42624] It is appreciated that VGAM3047 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3047 host target genes. The mRNA of

each one of this plurality of VGAM3047 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3047 RNA, herein designated VGAM RNA, and which when bound by VGAM3047 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3047 host target proteins.

[42625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3047 gene, herein designated VGAM GENE, on one or more VGAM3047 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[42626] It is yet further appreciated that a function of VGAM3047 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3047 include diagnosis, prevention and treatment of viral infection by Horseradish curly top virus. Specific functions, and accordingly utilities, of VGAM3047 correlate with, and may be deduced from, the identity of the host target genes which VGAM3047 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42627] Nucleotide sequences of the VGAM3047 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3047 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3047 are further described hereinbelow with reference to Table 1.

[42628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3047 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[42629] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3048 (VGAM3048) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42630] VGAM3048 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3048 was detected is described hereinabove with reference to Figs. 2–8.

[42631] VGAM3048 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3048 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42632] VGAM3048 gene, herein designated VGAM GENE, encodes a VGAM3048 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3048 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3048 precursor RNA is designated SEQ ID:69455, and is provided hereinbelow with reference to the sequence listing part.

[42633] VGAM3048 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42634] An enzyme complex designated DICER COMPLEX, dices the VGAM3048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3048 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3048 RNA is designated SEQ ID:69456,

and is provided hereinbelow with reference to the sequence listing part.

[42635] VGAM3048 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42636] VGAM3048 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3048 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3048 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42637] The complementary binding of VGAM3048 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3048 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3048 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42638] It is appreciated that VGAM3048 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3048 host target genes. The mRNA of each one of this plurality of VGAM3048 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3048 RNA, herein designated VGAM RNA, and which when bound by VGAM3048 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3048 host target proteins.

[42639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3048 gene, herein designated VGAM GENE, on one or more VGAM3048 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42640] It is yet further appreciated that a function of VGAM3048 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3048 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3048 correlate with, and may be deduced from, the identity of the host target genes which VGAM3048 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42641] Nucleotide sequences of the VGAM3048 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3048 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3048 are further described hereinbelow with reference to Table 1.

[42642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3048 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42643] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3049 (VGAM3049) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42644] VGAM3049 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3049 was detected is described hereinabove with reference to Figs. 2–8.

[42645] VGAM3049 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3049 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42646] VGAM3049 gene, herein designated VGAM GENE, encodes a VGAM3049 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3049 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3049 precu-

sor RNA is designated SEQ ID:69460, and is provided hereinbelow with reference to the sequence listing part.

[42647] VGAM3049 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42648] An enzyme complex designated DICER COMPLEX, dices the VGAM3049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3049 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3049 RNA is designated SEQ ID:69461, and is provided hereinbelow with reference to the se-

quence listing part.

[42649] VGAM3049 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42650] VGAM3049 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3049 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3049 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42651] The complementary binding of VGAM3049 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3049 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3049 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42652] It is appreciated that VGAM3049 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3049 host target genes. The mRNA of each one of this plurality of VGAM3049 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3049 RNA, herein designated VGAM RNA, and which when bound by VGAM3049 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3049 host target proteins.

[42653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3049 gene, herein designated VGAM GENE, on one or more VGAM3049 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42654] It is yet further appreciated that a function of VGAM3049

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3049 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3049 correlate with, and may be deduced from, the identity of the host target genes which VGAM3049 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42655] Nucleotide sequences of the VGAM3049 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3049 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3049 are further described hereinbelow with reference to Table 1.

[42656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3049 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42657] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3050 (VGAM3050) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42658] VGAM3050 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3050 was detected is described hereinabove with reference to Figs. 2–8.

[42659] VGAM3050 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3050 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42660] VGAM3050 gene, herein designated VGAM GENE, encodes a VGAM3050 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3050 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3050 precursor RNA is designated SEQ ID:69507, and is provided

hereinbelow with reference to the sequence listing part.

[42661] VGAM3050 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42662] An enzyme complex designated DICER COMPLEX, dices the VGAM3050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3050 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3050 RNA is designated SEQ ID:69508, and is provided hereinbelow with reference to the sequence listing part.

[42663] VGAM3050 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42664] VGAM3050 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3050 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3050 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42665] The complementary binding of VGAM3050 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3050 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3050 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42666] It is appreciated that VGAM3050 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3050 host target genes. The mRNA of each one of this plurality of VGAM3050 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3050 RNA, herein designated VGAM RNA, and which when bound by VGAM3050 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3050 host target proteins.

[42667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3050 gene, herein designated VGAM GENE, on one or more VGAM3050 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42668] It is yet further appreciated that a function of VGAM3050 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3050 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3050 correlate with, and may be deduced from, the identity of the host target genes which VGAM3050 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42669] Nucleotide sequences of the VGAM3050 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3050 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3050 are further described hereinbelow with reference to Table 1.

[42670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3050 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42671] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3051 (VGAM3051) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42672] VGAM3051 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3051 was detected is described hereinabove with reference to Figs. 2–8.

[42673] VGAM3051 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3051 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42674] VGAM3051 gene, herein designated VGAM GENE, encodes a VGAM3051 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3051 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3051 precursor RNA is designated SEQ ID:69513, and is provided hereinbelow with reference to the sequence listing part.

[42675] VGAM3051 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42676] An enzyme complex designated DICER COMPLEX, dices the VGAM3051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3051 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3051 RNA is designated SEQ ID:69514, and is provided hereinbelow with reference to the sequence listing part.

[42677] VGAM3051 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42678] VGAM3051 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3051 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3051 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42679] The complementary binding of VGAM3051 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3051 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3051 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42680] It is appreciated that VGAM3051 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3051 host target genes. The mRNA of each one of this plurality of VGAM3051 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3051 RNA, herein designated VGAM

RNA, and which when bound by VGAM3051 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3051 host target proteins.

[42681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3051 gene, herein designated VGAM GENE, on one or more VGAM3051 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42682] It is yet further appreciated that a function of VGAM3051 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3051 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3051 correlate with, and may be deduced from, the identity of the host target genes which VGAM3051 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42683] Nucleotide sequences of the VGAM3051 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3051 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3051 are further described hereinbelow with reference to Table 1.

[42684] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3051 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42685] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3052 (VGAM3052) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42686] VGAM3052 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3052 was detected is described hereinabove with reference to Figs. 2-8.

[42687] VGAM3052 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis C virus. VGAM3052 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42688] VGAM3052 gene, herein designated VGAM GENE, encodes a VGAM3052 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3052 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3052 precursor RNA is designated SEQ ID:69531, and is provided hereinbelow with reference to the sequence listing part.

[42689] VGAM3052 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42690] An enzyme complex designated DICER COMPLEX, dices the VGAM3052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3052 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3052 RNA is designated SEQ ID:69532, and is provided hereinbelow with reference to the sequence listing part.

[42691] VGAM3052 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3052 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3052 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42692] VGAM3052 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3052 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3052 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3052 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3052 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42693] The complementary binding of VGAM3052 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3052 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3052 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3052 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42694] It is appreciated that VGAM3052 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3052 host target genes. The mRNA of each one of this plurality of VGAM3052 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3052 RNA, herein designated VGAM RNA, and which when bound by VGAM3052 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3052 host target proteins.

[42695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3052 gene, herein designated VGAM GENE, on one or more VGAM3052 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42696] It is yet further appreciated that a function of VGAM3052 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3052 include diagnosis, prevention and

treatment of viral infection by Hepatitis C virus. Specific functions, and accordingly utilities, of VGAM3052 correlate with, and may be deduced from, the identity of the host target genes which VGAM3052 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42697] Nucleotide sequences of the VGAM3052 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3052 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3052 are further described hereinbelow with reference to Table 1.

[42698] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3052 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42699] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3053 (VGAM3053) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42700] VGAM3053 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3053 was detected is described hereinabove with reference to Figs. 2–8.

[42701] VGAM3053 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3053 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42702] VGAM3053 gene, herein designated VGAM GENE, encodes a VGAM3053 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3053 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3053 precursor RNA is designated SEQ ID:69540, and is provided hereinbelow with reference to the sequence listing part.

[42703] VGAM3053 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3053 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42704] An enzyme complex designated DICER COMPLEX, dices the VGAM3053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3053 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3053 RNA is designated SEQ ID:69541, and is provided hereinbelow with reference to the sequence listing part.

[42705] VGAM3053 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3053 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3053 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42706] VGAM3053 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3053 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3053 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3053 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3053 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42707] The complementary binding of VGAM3053 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3053 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3053 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3053 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42708] It is appreciated that VGAM3053 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3053 host target genes. The mRNA of each one of this plurality of VGAM3053 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3053 RNA, herein designated VGAM RNA, and which when bound by VGAM3053 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3053 host target proteins.

[42709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3053 gene, herein designated VGAM GENE, on one or more VGAM3053 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42710] It is yet further appreciated that a function of VGAM3053 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3053 include diagnosis, prevention and treatment of viral infection by Amsacta moorei ento-

mopoxvirus. Specific functions, and accordingly utilities, of VGAM3053 correlate with, and may be deduced from, the identity of the host target genes which VGAM3053 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42711] Nucleotide sequences of the VGAM3053 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3053 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3053 are further described hereinbelow with reference to Table 1.

[42712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3053 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42713] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3054 (VGAM3054) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[42714] VGAM3054 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3054 was detected is described hereinabove with reference to Figs. 2–8.

[42715] VGAM3054 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3054 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42716] VGAM3054 gene, herein designated VGAM GENE, encodes a VGAM3054 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3054 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3054 precursor RNA is designated SEQ ID:69545, and is provided hereinbelow with reference to the sequence listing part.

[42717] VGAM3054 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3054 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42718] An enzyme complex designated DICER COMPLEX, dices the VGAM3054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3054 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3054 RNA is designated SEQ ID:69546, and is provided hereinbelow with reference to the sequence listing part.

[42719] VGAM3054 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3054 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3054 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42720] VGAM3054 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3054 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3054 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3054 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3054 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42721] The complementary binding of VGAM3054 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3054 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3054 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3054 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42722] It is appreciated that VGAM3054 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3054 host target genes. The mRNA of each one of this plurality of VGAM3054 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3054 RNA, herein designated VGAM RNA, and which when bound by VGAM3054 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3054 host target proteins.

[42723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3054 gene, herein designated VGAM GENE, on one or more VGAM3054 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42724] It is yet further appreciated that a function of VGAM3054 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3054 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities,

of VGAM3054 correlate with, and may be deduced from, the identity of the host target genes which VGAM3054 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42725] Nucleotide sequences of the VGAM3054 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3054 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3054 are further described hereinbelow with reference to Table 1.

[42726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3054 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42727] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3055 (VGAM3055) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[42728] VGAM3055 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3055 was detected is described hereinabove with reference to Figs. 2–8.

[42729] VGAM3055 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck adenovirus A. VGAM3055 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42730] VGAM3055 gene, herein designated VGAM GENE, encodes a VGAM3055 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3055 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3055 precursor RNA is designated SEQ ID:69554, and is provided hereinbelow with reference to the sequence listing part.

[42731] VGAM3055 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42732] An enzyme complex designated DICER COMPLEX, dices the VGAM3055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3055 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3055 RNA is designated SEQ ID:69555, and is provided hereinbelow with reference to the sequence listing part.

[42733] VGAM3055 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42734] VGAM3055 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3055 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3055 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42735] The complementary binding of VGAM3055 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3055 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3055 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42736] It is appreciated that VGAM3055 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3055 host target genes. The mRNA of each one of this plurality of VGAM3055 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3055 RNA, herein designated VGAM RNA, and which when bound by VGAM3055 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3055 host target proteins.

[42737] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3055 gene, herein designated VGAM GENE, on one or more VGAM3055 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42738] It is yet further appreciated that a function of VGAM3055 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3055 include diagnosis, prevention and treatment of viral infection by Duck adenovirus A. Specific functions, and accordingly utilities, of VGAM3055 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3055 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42739] Nucleotide sequences of the VGAM3055 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3055 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3055 are further described hereinbelow with reference to Table 1.

[42740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3055 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42741] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3056 (VGAM3056) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42742] VGAM3056 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3056 was detected is described hereinabove with reference to Figs. 2–8.

[42743] VGAM3056 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3056 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42744] VGAM3056 gene, herein designated VGAM GENE, encodes a VGAM3056 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3056 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3056 precursor RNA is designated SEQ ID:69588, and is provided hereinbelow with reference to the sequence listing part.

[42745] VGAM3056 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42746] An enzyme complex designated DICER COMPLEX, dices the VGAM3056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3056 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3056 RNA is designated SEQ ID:69589, and is provided hereinbelow with reference to the sequence listing part.

[42747] VGAM3056 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42748] VGAM3056 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3056 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3056 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42749] The complementary binding of VGAM3056 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3056 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3056 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42750] It is appreciated that VGAM3056 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3056 host target genes. The mRNA of each one of this plurality of VGAM3056 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3056 RNA, herein designated VGAM RNA, and which when bound by VGAM3056 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3056 host target proteins.

[42751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3056 gene, herein designated VGAM GENE, on one or more VGAM3056 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42752] It is yet further appreciated that a function of VGAM3056 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3056 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3056 correlate with, and may be deduced from, the identity of the host target genes which VGAM3056 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[42753] Nucleotide sequences of the VGAM3056 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3056 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3056 are further described hereinbelow with reference to Table 1.

[42754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3056 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42755] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3057 (VGAM3057) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42756] VGAM3057 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3057 was detected is described hereinabove with reference to Figs. 2–8.

[42757] VGAM3057 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus.

VGAM3057 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42758] VGAM3057 gene, herein designated VGAM GENE, encodes a VGAM3057 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3057 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3057 precursor RNA is designated SEQ ID:69596, and is provided hereinbelow with reference to the sequence listing part.

[42759] VGAM3057 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42760] An enzyme complex designated DICER COMPLEX, dices the VGAM3057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3057 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3057 RNA is designated SEQ ID:69597, and is provided hereinbelow with reference to the sequence listing part.

[42761] VGAM3057 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42762] VGAM3057 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3057 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3057 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[42763] The complementary binding of VGAM3057 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3057 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3057 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42764] It is appreciated that VGAM3057 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3057 host target genes. The mRNA of each one of this plurality of VGAM3057 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3057 RNA, herein designated VGAM RNA, and which when bound by VGAM3057 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3057 host target proteins.

[42765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3057 gene, herein designated VGAM GENE, on one or more VGAM3057 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42766] It is yet further appreciated that a function of VGAM3057 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3057 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus. Specific functions, and accordingly utilities, of VGAM3057 correlate with, and may be deduced from, the identity of the host target genes which VGAM3057 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[42767] Nucleotide sequences of the VGAM3057 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3057 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3057 are further described hereinbelow with reference to Table 1.

[42768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3057 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42769] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3058 (VGAM3058) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42770] VGAM3058 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3058 was detected is described hereinabove with reference to Figs. 2–8.

[42771] VGAM3058 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Reston Ebola virus.

VGAM3058 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42772] VGAM3058 gene, herein designated VGAM GENE, encodes a VGAM3058 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3058 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3058 precursor RNA is designated SEQ ID:69600, and is provided hereinbelow with reference to the sequence listing part.

[42773] VGAM3058 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42774] An enzyme complex designated DICER COMPLEX, dices the VGAM3058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3058 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3058 RNA is designated SEQ ID:69601, and is provided hereinbelow with reference to the sequence listing part.

[42775] VGAM3058 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[42776] VGAM3058 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3058 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3058 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42777] The complementary binding of VGAM3058 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3058 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3058 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42778] It is appreciated that VGAM3058 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3058 host target genes. The mRNA of each one of this plurality of VGAM3058 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3058 RNA, herein designated VGAM RNA, and which when bound by VGAM3058 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3058 host target proteins.

[42779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3058 gene, herein designated VGAM GENE, on one

or more VGAM3058 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42780] It is yet further appreciated that a function of VGAM3058 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3058 include diagnosis, prevention and treatment of viral infection by Reston Ebola virus. Specific functions, and accordingly utilities, of VGAM3058 correlate with, and may be deduced from, the identity of the host target genes which VGAM3058 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42781] Nucleotide sequences of the VGAM3058 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3058 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3058 are further described hereinbelow with reference to Table 1.

[42782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3058 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42783] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3059 (VGAM3059) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42784] VGAM3059 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3059 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[42785] VGAM3059 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus.

VGAM3059 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42786] VGAM3059 gene, herein designated VGAM GENE, encodes a VGAM3059 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3059 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3059 precursor RNA is designated SEQ ID:69678, and is provided hereinbelow with reference to the sequence listing part.

[42787] VGAM3059 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42788] An enzyme complex designated DICER COMPLEX, dices the VGAM3059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3059 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3059 RNA is designated SEQ ID:69679, and is provided hereinbelow with reference to the sequence listing part.

[42789] VGAM3059 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42790] VGAM3059 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3059 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3059 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42791] The complementary binding of VGAM3059 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3059 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3059 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42792] It is appreciated that VGAM3059 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3059 host target genes. The mRNA of each one of this plurality of VGAM3059 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3059 RNA, herein designated VGAM RNA, and which when bound by VGAM3059 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3059 host target proteins.

[42793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3059 gene, herein designated VGAM GENE, on one or more VGAM3059 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42794] It is yet further appreciated that a function of VGAM3059 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3059 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3059 correlate with, and may be deduced from, the identity of the host target genes which VGAM3059 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42795] Nucleotide sequences of the VGAM3059 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3059 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3059 are further described hereinbelow with reference to Table 1.

[42796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3059 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42797] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3060 (VGAM3060) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42798] VGAM3060 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3060 was detected is described hereinabove with reference to Figs. 2-8.

[42799] VGAM3060 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Polyomavirus muris. VGAM3060 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42800] VGAM3060 gene, herein designated VGAM GENE, encodes a VGAM3060 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3060 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3060 precursor RNA is designated SEQ ID:69692, and is provided hereinbelow with reference to the sequence listing part.

[42801] VGAM3060 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[42802] An enzyme complex designated DICER COMPLEX, dices the VGAM3060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3060 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3060 RNA is designated SEQ ID:69693, and is provided hereinbelow with reference to the sequence listing part.

[42803] VGAM3060 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42804] VGAM3060 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3060 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3060 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42805] The complementary binding of VGAM3060 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3060 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3060 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42806] It is appreciated that VGAM3060 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3060 host target genes. The mRNA of each one of this plurality of VGAM3060 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3060 RNA, herein designated VGAM RNA, and which when bound by VGAM3060 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3060 host target proteins.

[42807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3060 gene, herein designated VGAM GENE, on one or more VGAM3060 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42808] It is yet further appreciated that a function of VGAM3060 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3060 include diagnosis, prevention and treatment of viral infection by Polyomavirus muris. Specific functions, and accordingly utilities, of VGAM3060 correlate with, and may be deduced from, the identity of the host target genes which VGAM3060 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42809] Nucleotide sequences of the VGAM3060 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3060 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3060 are further described hereinbelow with reference to Table 1.

[42810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3060 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42811] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3061 (VGAM3061) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42812] VGAM3061 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3061 was detected is described hereinabove with reference to Figs. 2-8.

[42813] VGAM3061 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of *Macaca mulatta* rhadinovirus. VGAM3061 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42814] VGAM3061 gene, herein designated VGAM GENE, encodes a VGAM3061 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3061 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3061 precursor RNA is designated SEQ ID:69705, and is provided hereinbelow with reference to the sequence listing part.

[42815] VGAM3061 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42816] An enzyme complex designated DICER COMPLEX, dices the VGAM3061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3061 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3061 RNA is designated SEQ ID:69706, and is provided hereinbelow with reference to the sequence listing part.

[42817] VGAM3061 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42818] VGAM3061 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3061 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3061 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42819] The complementary binding of VGAM3061 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3061 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3061 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42820] It is appreciated that VGAM3061 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3061 host target genes. The mRNA of each one of this plurality of VGAM3061 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3061 RNA, herein designated VGAM RNA, and which when bound by VGAM3061 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3061 host target proteins.

[42821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3061 gene, herein designated VGAM GENE, on one or more VGAM3061 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42822] It is yet further appreciated that a function of VGAM3061 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3061 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM3061 correlate with, and may be deduced from, the identity of the host target genes which VGAM3061 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42823] Nucleotide sequences of the VGAM3061 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3061 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3061 are further described hereinbelow with reference to Table 1.

[42824] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3061 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42825] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3062 (VGAM3062) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42826] VGAM3062 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3062 was detected is described hereinabove with reference to Figs. 2–8.

[42827] VGAM3062 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM3062 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42828] VGAM3062 gene, herein designated VGAM GENE, encodes a VGAM3062 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3062 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3062 precursor RNA is designated SEQ ID:69710, and is provided hereinbelow with reference to the sequence listing part.

[42829] VGAM3062 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42830] An enzyme complex designated DICER COMPLEX, dices the VGAM3062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3062 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3062 RNA is designated SEQ ID:69711, and is provided hereinbelow with reference to the sequence listing part.

[42831] VGAM3062 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42832] VGAM3062 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3062 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3062 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42833] The complementary binding of VGAM3062 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3062 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3062 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42834] It is appreciated that VGAM3062 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3062 host target genes. The mRNA of each one of this plurality of VGAM3062 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3062 RNA, herein designated VGAM

RNA, and which when bound by VGAM3062 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3062 host target proteins.

[42835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3062 gene, herein designated VGAM GENE, on one or more VGAM3062 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42836] It is yet further appreciated that a function of VGAM3062 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3062 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3062 correlate with, and may be deduced from, the identity of the host target genes which VGAM3062 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42837] Nucleotide sequences of the VGAM3062 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3062 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3062 are further described hereinbelow with reference to Table 1.

[42838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3062 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42839] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3063 (VGAM3063) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42840] VGAM3063 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3063 was detected is described hereinabove with reference to Figs. 2-8.

[42841] VGAM3063 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM3063 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42842] VGAM3063 gene, herein designated VGAM GENE, encodes a VGAM3063 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3063 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3063 precursor RNA is designated SEQ ID:69742, and is provided hereinbelow with reference to the sequence listing part.

[42843] VGAM3063 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42844] An enzyme complex designated DICER COMPLEX, dices the VGAM3063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3063 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3063 RNA is designated SEQ ID:69743, and is provided hereinbelow with reference to the sequence listing part.

[42845] VGAM3063 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3063 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3063 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42846] VGAM3063 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3063 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3063 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3063 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3063 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42847] The complementary binding of VGAM3063 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3063 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3063 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3063 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42848] It is appreciated that VGAM3063 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3063 host target genes. The mRNA of each one of this plurality of VGAM3063 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3063 RNA, herein designated VGAM RNA, and which when bound by VGAM3063 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3063 host target proteins.

[42849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3063 gene, herein designated VGAM GENE, on one or more VGAM3063 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42850] It is yet further appreciated that a function of VGAM3063 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3063 include diagnosis, prevention and

treatment of viral infection by *Rana tigrina* ranavirus. Specific functions, and accordingly utilities, of VGAM3063 correlate with, and may be deduced from, the identity of the host target genes which VGAM3063 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42851] Nucleotide sequences of the VGAM3063 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3063 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3063 are further described hereinbelow with reference to Table 1.

[42852] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3063 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42853] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3064 (VGAM3064) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42854] VGAM3064 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3064 was detected is described hereinabove with reference to Figs. 2–8.

[42855] VGAM3064 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3064 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42856] VGAM3064 gene, herein designated VGAM GENE, encodes a VGAM3064 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3064 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3064 precursor RNA is designated SEQ ID:69782, and is provided hereinbelow with reference to the sequence listing part.

[42857] VGAM3064 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3064 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42858] An enzyme complex designated DICER COMPLEX, dices the VGAM3064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3064 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3064 RNA is designated SEQ ID:69783, and is provided hereinbelow with reference to the sequence listing part.

[42859] VGAM3064 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3064 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3064 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42860] VGAM3064 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3064 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3064 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3064 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3064 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42861] The complementary binding of VGAM3064 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3064 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3064 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3064 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42862] It is appreciated that VGAM3064 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3064 host target genes. The mRNA of each one of this plurality of VGAM3064 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3064 RNA, herein designated VGAM RNA, and which when bound by VGAM3064 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3064 host target proteins.

[42863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3064 gene, herein designated VGAM GENE, on one or more VGAM3064 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42864] It is yet further appreciated that a function of VGAM3064 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3064 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific

functions, and accordingly utilities, of VGAM3064 correlate with, and may be deduced from, the identity of the host target genes which VGAM3064 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42865] Nucleotide sequences of the VGAM3064 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3064 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3064 are further described hereinbelow with reference to Table 1.

[42866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3064 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42867] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3065 (VGAM3065) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[42868] VGAM3065 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3065 was detected is described hereinabove with reference to Figs. 2–8.

[42869] VGAM3065 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3065 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42870] VGAM3065 gene, herein designated VGAM GENE, encodes a VGAM3065 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3065 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3065 precursor RNA is designated SEQ ID:69796, and is provided hereinbelow with reference to the sequence listing part.

[42871] VGAM3065 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3065 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42872] An enzyme complex designated DICER COMPLEX, dices the VGAM3065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3065 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3065 RNA is designated SEQ ID:69797, and is provided hereinbelow with reference to the sequence listing part.

[42873] VGAM3065 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3065 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3065 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42874] VGAM3065 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3065 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3065 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3065 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3065 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42875] The complementary binding of VGAM3065 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3065 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3065 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3065 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42876] It is appreciated that VGAM3065 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3065 host target genes. The mRNA of each one of this plurality of VGAM3065 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3065 RNA, herein designated VGAM RNA, and which when bound by VGAM3065 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3065 host target proteins.

[42877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3065 gene, herein designated VGAM GENE, on one or more VGAM3065 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42878] It is yet further appreciated that a function of VGAM3065 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3065 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3065

correlate with, and may be deduced from, the identity of the host target genes which VGAM3065 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42879] Nucleotide sequences of the VGAM3065 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3065 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3065 are further described hereinbelow with reference to Table 1.

[42880] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3065 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42881] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3066 (VGAM3066) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[42882] VGAM3066 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3066 was detected is described hereinabove with reference to Figs. 2–8.

[42883] VGAM3066 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3066 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42884] VGAM3066 gene, herein designated VGAM GENE, encodes a VGAM3066 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3066 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3066 precursor RNA is designated SEQ ID:69830, and is provided hereinbelow with reference to the sequence listing part.

[42885] VGAM3066 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42886] An enzyme complex designated DICER COMPLEX, dices the VGAM3066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3066 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3066 RNA is designated SEQ ID:69831, and is provided hereinbelow with reference to the sequence listing part.

[42887] VGAM3066 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42888] VGAM3066 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3066 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3066 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42889] The complementary binding of VGAM3066 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3066 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3066 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42890] It is appreciated that VGAM3066 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3066 host target genes. The mRNA of each one of this plurality of VGAM3066 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3066 RNA, herein designated VGAM RNA, and which when bound by VGAM3066 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3066 host target proteins.

[42891] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3066 gene, herein designated VGAM GENE, on one or more VGAM3066 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42892] It is yet further appreciated that a function of VGAM3066 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3066 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3066 correlate with, and may be deduced

from, the identity of the host target genes which VGAM3066 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42893] Nucleotide sequences of the VGAM3066 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3066 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3066 are further described hereinbelow with reference to Table 1.

[42894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3066 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42895] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3067 (VGAM3067) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42896] VGAM3067 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3067 was detected is described hereinabove with reference to Figs. 2-8.

[42897] VGAM3067 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3067 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42898] VGAM3067 gene, herein designated VGAM GENE, encodes a VGAM3067 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3067 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3067 precursor RNA is designated SEQ ID:69902, and is provided hereinbelow with reference to the sequence listing part.

[42899] VGAM3067 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42900] An enzyme complex designated DICER COMPLEX, dices the VGAM3067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3067 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3067 RNA is designated SEQ ID:69903, and is provided hereinbelow with reference to the sequence listing part.

[42901] VGAM3067 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42902] VGAM3067 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3067 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3067 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42903] The complementary binding of VGAM3067 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3067 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3067 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42904] It is appreciated that VGAM3067 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3067 host target genes. The mRNA of each one of this plurality of VGAM3067 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3067 RNA, herein designated VGAM RNA, and which when bound by VGAM3067 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3067 host target proteins.

[42905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3067 gene, herein designated VGAM GENE, on one or more VGAM3067 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42906] It is yet further appreciated that a function of VGAM3067 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3067 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3067 correlate with, and may be deduced from, the identity of the host target genes which

VGAM3067 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42907] Nucleotide sequences of the VGAM3067 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3067 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3067 are further described hereinbelow with reference to Table 1.

[42908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3067 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42909] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3068 (VGAM3068) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42910] VGAM3068 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3068 was detected is described hereinabove with reference to Figs. 2–8.

[42911] VGAM3068 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3068 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42912] VGAM3068 gene, herein designated VGAM GENE, encodes a VGAM3068 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3068 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3068 precursor RNA is designated SEQ ID:69908, and is provided hereinbelow with reference to the sequence listing part.

[42913] VGAM3068 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42914] An enzyme complex designated DICER COMPLEX, dices the VGAM3068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3068 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3068 RNA is designated SEQ ID:69909, and is provided hereinbelow with reference to the sequence listing part.

[42915] VGAM3068 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42916] VGAM3068 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3068 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3068 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[42917] The complementary binding of VGAM3068 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3068 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3068 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42918] It is appreciated that VGAM3068 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3068 host target genes. The mRNA of each one of this plurality of VGAM3068 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3068 RNA, herein designated VGAM RNA, and which when bound by VGAM3068 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3068 host target proteins.

[42919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3068 gene, herein designated VGAM GENE, on one or more VGAM3068 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42920] It is yet further appreciated that a function of VGAM3068 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3068 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3068 correlate with, and may be deduced from, the identity of the host target genes which VGAM3068 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[42921] Nucleotide sequences of the VGAM3068 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3068 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3068 are further described hereinbelow with reference to Table 1.

[42922] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3068 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42923] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3069 (VGAM3069) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42924] VGAM3069 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3069 was detected is described hereinabove with reference to Figs. 2–8.

[42925] VGAM3069 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine teschovirus. VGAM3069 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42926] VGAM3069 gene, herein designated VGAM GENE, encodes a VGAM3069 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3069 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3069 precursor RNA is designated SEQ ID:69921, and is provided hereinbelow with reference to the sequence listing part.

[42927] VGAM3069 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42928] An enzyme complex designated DICER COMPLEX, dices the VGAM3069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3069 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3069 RNA is designated SEQ ID:69922, and is provided hereinbelow with reference to the sequence listing part.

[42929] VGAM3069 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[42930] VGAM3069 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3069 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3069 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42931] The complementary binding of VGAM3069 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3069 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3069 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42932] It is appreciated that VGAM3069 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3069 host target genes. The mRNA of each one of this plurality of VGAM3069 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3069 RNA, herein designated VGAM RNA, and which when bound by VGAM3069 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3069 host target proteins.

[42933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3069 gene, herein designated VGAM GENE, on one

or more VGAM3069 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42934] It is yet further appreciated that a function of VGAM3069 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3069 include diagnosis, prevention and treatment of viral infection by Porcine teschovirus. Specific functions, and accordingly utilities, of VGAM3069 correlate with, and may be deduced from, the identity of the host target genes which VGAM3069 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42935] Nucleotide sequences of the VGAM3069 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3069 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3069 are further described hereinbelow with reference to Table 1.

[42936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3069 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42937] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3070 (VGAM3070) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42938] VGAM3070 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3070 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[42939] VGAM3070 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine epidemic diarrhea virus. VGAM3070 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42940] VGAM3070 gene, herein designated VGAM GENE, encodes a VGAM3070 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3070 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3070 precursor RNA is designated SEQ ID:69940, and is provided hereinbelow with reference to the sequence listing part.

[42941] VGAM3070 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42942] An enzyme complex designated DICER COMPLEX, dices the VGAM3070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3070 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3070 RNA is designated SEQ ID:69941, and is provided hereinbelow with reference to the sequence listing part.

[42943] VGAM3070 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42944] VGAM3070 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3070 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3070 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42945] The complementary binding of VGAM3070 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3070 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3070 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42946] It is appreciated that VGAM3070 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3070 host target genes. The mRNA of each one of this plurality of VGAM3070 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3070 RNA, herein designated VGAM RNA, and which when bound by VGAM3070 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3070 host target proteins.

[42947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3070 gene, herein designated VGAM GENE, on one or more VGAM3070 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42948] It is yet further appreciated that a function of VGAM3070 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3070 include diagnosis, prevention and treatment of viral infection by Porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM3070 correlate with, and may be deduced from, the identity of the host target genes which VGAM3070 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42949] Nucleotide sequences of the VGAM3070 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3070 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3070 are further described hereinbelow with reference to Table 1.

[42950] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3070 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42951] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3071 (VGAM3071) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42952] VGAM3071 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3071 was detected is described hereinabove with reference to Figs. 2-8.

[42953] VGAM3071 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3071 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42954] VGAM3071 gene, herein designated VGAM GENE, encodes a VGAM3071 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3071 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3071 precursor RNA is designated SEQ ID:69949, and is provided hereinbelow with reference to the sequence listing part.

[42955] VGAM3071 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[42956] An enzyme complex designated DICER COMPLEX, dices the VGAM3071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3071 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3071 RNA is designated SEQ ID:69950, and is provided hereinbelow with reference to the sequence listing part.

[42957] VGAM3071 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42958] VGAM3071 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3071 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3071 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42959] The complementary binding of VGAM3071 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3071 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3071 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42960] It is appreciated that VGAM3071 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3071 host target genes. The mRNA of each one of this plurality of VGAM3071 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3071 RNA, herein designated VGAM RNA, and which when bound by VGAM3071 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3071 host target proteins.

[42961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3071 gene, herein designated VGAM GENE, on one or more VGAM3071 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42962] It is yet further appreciated that a function of VGAM3071 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3071 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3071 correlate with, and may be deduced from, the identity of the host target genes which VGAM3071 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42963] Nucleotide sequences of the VGAM3071 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3071 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3071 are further described hereinbelow with reference to Table 1.

[42964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3071 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42965] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3072 (VGAM3072) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42966] VGAM3072 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3072 was detected is described hereinabove with reference to Figs. 2-8.

[42967] VGAM3072 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM3072 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42968] VGAM3072 gene, herein designated VGAM GENE, encodes a VGAM3072 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3072 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3072 precursor RNA is designated SEQ ID:69963, and is provided hereinbelow with reference to the sequence listing part.

[42969] VGAM3072 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42970] An enzyme complex designated DICER COMPLEX, dices the VGAM3072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3072 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3072 RNA is designated SEQ ID:69964, and is provided hereinbelow with reference to the sequence listing part.

[42971] VGAM3072 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3072 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3072 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42972] VGAM3072 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3072 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3072 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3072 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3072 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42973] The complementary binding of VGAM3072 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3072 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3072 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3072 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42974] It is appreciated that VGAM3072 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3072 host target genes. The mRNA of each one of this plurality of VGAM3072 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3072 RNA, herein designated VGAM RNA, and which when bound by VGAM3072 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3072 host target proteins.

[42975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3072 gene, herein designated VGAM GENE, on one or more VGAM3072 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42976] It is yet further appreciated that a function of VGAM3072 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3072 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3072 correlate with, and may be deduced from, the identity of the host target genes which VGAM3072 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42977] Nucleotide sequences of the VGAM3072 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3072 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3072 are further described hereinbelow with reference to Table 1.

[42978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3072 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42979] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3073 (VGAM3073) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42980] VGAM3073 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3073 was detected is described hereinabove with reference to Figs. 2-8.

[42981] VGAM3073 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3073 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42982] VGAM3073 gene, herein designated VGAM GENE, encodes a VGAM3073 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3073 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3073 precursor RNA is designated SEQ ID:70002, and is provided hereinbelow with reference to the sequence listing part.

[42983] VGAM3073 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42984] An enzyme complex designated DICER COMPLEX, dices

the VGAM3073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3073 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3073 RNA is designated SEQ ID:70003, and is provided hereinbelow with reference to the sequence listing part.

[42985] VGAM3073 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3073 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3073 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42986] VGAM3073 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3073 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3073 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3073 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3073 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42987] The complementary binding of VGAM3073 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3073 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3073 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3073 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42988] It is appreciated that VGAM3073 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3073 host target genes. The mRNA of each one of this plurality of VGAM3073 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3073 RNA, herein designated VGAM RNA, and which when bound by VGAM3073 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3073 host target proteins.

[42989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3073 gene, herein designated VGAM GENE, on one or more VGAM3073 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42990] It is yet further appreciated that a function of VGAM3073 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3073 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3073 correlate with, and may be deduced from, the identity of the host target genes which VGAM3073 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42991] Nucleotide sequences of the VGAM3073 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3073 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3073 are further described hereinbelow with reference to Table 1.

[42992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3073 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42993] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3074 (VGAM3074) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42994] VGAM3074 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3074 was detected is described hereinabove with reference to Figs. 2-8.

[42995] VGAM3074 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3074 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[42996] VGAM3074 gene, herein designated VGAM GENE, encodes a VGAM3074 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3074 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3074 precursor RNA is designated SEQ ID:70005, and is provided hereinbelow with reference to the sequence listing part.

[42997] VGAM3074 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42998] An enzyme complex designated DICER COMPLEX, dices the VGAM3074 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3074 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3074 RNA is designated SEQ ID:70006, and is provided hereinbelow with reference to the sequence listing part.

[42999] VGAM3074 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3074 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3074 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43000] VGAM3074 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3074 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3074 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3074 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3074 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43001] The complementary binding of VGAM3074 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3074 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3074

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3074 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43002] It is appreciated that VGAM3074 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3074 host target genes. The mRNA of each one of this plurality of VGAM3074 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3074 RNA, herein designated VGAM RNA, and which when bound by VGAM3074 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3074 host target proteins.

[43003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3074 gene, herein designated VGAM GENE, on one or more VGAM3074 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43004] It is yet further appreciated that a function of VGAM3074 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3074 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3074 correlate with, and may be deduced from, the identity of the host target genes which VGAM3074 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43005] Nucleotide sequences of the VGAM3074 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3074 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3074 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3074 are further described hereinbelow with reference to Table 1.

[43006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3074 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43007] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3075 (VGAM3075) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43008] VGAM3075 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3075 was detected is described hereinabove with reference to Figs. 2-8.

[43009] VGAM3075 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 47. VGAM3075 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[43010] VGAM3075 gene, herein designated VGAM GENE, encodes a VGAM3075 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3075 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3075 precursor RNA is designated SEQ ID:70011, and is provided hereinbelow with reference to the sequence listing part.

[43011] VGAM3075 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43012] An enzyme complex designated DICER COMPLEX, dices the VGAM3075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3075 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3075 RNA is designated SEQ ID:70012, and is provided hereinbelow with reference to the sequence listing part.

[43013] VGAM3075 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3075 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3075 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43014] VGAM3075 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3075 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3075 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3075 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3075 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43015] The complementary binding of VGAM3075 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3075 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3075 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3075 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43016] It is appreciated that VGAM3075 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3075 host target genes. The mRNA of each one of this plurality of VGAM3075 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3075 RNA, herein designated VGAM RNA, and which when bound by VGAM3075 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3075 host target proteins.

[43017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3075 gene, herein designated VGAM GENE, on one or more VGAM3075 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43018] It is yet further appreciated that a function of VGAM3075 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3075 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 47. Specific functions, and accordingly utilities, of VGAM3075 correlate with, and may be deduced from, the identity of the host target genes which VGAM3075 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43019] Nucleotide sequences of the VGAM3075 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3075 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3075 are further

described hereinbelow with reference to Table 1.

[43020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3075 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43021] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3076 (VGAM3076) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43022] VGAM3076 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3076 was detected is described hereinabove with reference to Figs. 2-8.

[43023] VGAM3076 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 47. VGAM3076 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43024] VGAM3076 gene, herein designated VGAM GENE, encodes a VGAM3076 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3076 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3076 precursor RNA is designated SEQ ID:70033, and is provided hereinbelow with reference to the sequence listing part.

[43025] VGAM3076 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43026] An enzyme complex designated DICER COMPLEX, dices the VGAM3076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3076 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3076 RNA is designated SEQ ID:70034, and is provided hereinbelow with reference to the sequence listing part.

[43027] VGAM3076 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43028] VGAM3076 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3076 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3076 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43029] The complementary binding of VGAM3076 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3076 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3076 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43030] It is appreciated that VGAM3076 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3076 host target genes. The mRNA of each one of this plurality of VGAM3076 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3076 RNA, herein designated VGAM RNA, and which when bound by VGAM3076 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3076 host target proteins.

[43031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3076 gene, herein designated VGAM GENE, on one or more VGAM3076 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43032] It is yet further appreciated that a function of VGAM3076 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3076 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 47. Specific functions, and accordingly utilities, of VGAM3076 correlate with, and may be deduced from, the identity of the host target genes which VGAM3076 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43033] Nucleotide sequences of the VGAM3076 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3076 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3076 are further described hereinbelow with reference to Table 1.

[43034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3076 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43035] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3077 (VGAM3077) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43036] VGAM3077 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3077 was detected is described hereinabove with reference to Figs. 2-8.

[43037] VGAM3077 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM3077 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43038] VGAM3077 gene, herein designated VGAM GENE, encodes

a VGAM3077 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3077 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3077 precursor RNA is designated SEQ ID:70047, and is provided hereinbelow with reference to the sequence listing part.

[43039] VGAM3077 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43040] An enzyme complex designated DICER COMPLEX, dices the VGAM3077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3077 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3077 RNA is designated SEQ ID:70048, and is provided hereinbelow with reference to the sequence listing part.

[43041] VGAM3077 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43042] VGAM3077 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3077 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3077 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43043] The complementary binding of VGAM3077 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3077 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3077 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[43044] It is appreciated that VGAM3077 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3077 host target genes. The mRNA of each one of this plurality of VGAM3077 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3077 RNA, herein designated VGAM RNA, and which when bound by VGAM3077 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3077 host target proteins.

[43045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3077 gene, herein designated VGAM GENE, on one or more VGAM3077 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43046] It is yet further appreciated that a function of VGAM3077 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3077 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3077 correlate with, and may be deduced from, the identity of the host target genes which VGAM3077 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43047] Nucleotide sequences of the VGAM3077 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3077 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3077 are further described hereinbelow with reference to Table 1.

[43048] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3077 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43049] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3078 (VGAM3078) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43050] VGAM3078 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3078 was detected is described hereinabove with reference to Figs. 2-8.

[43051] VGAM3078 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM3078 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43052] VGAM3078 gene, herein designated VGAM GENE, encodes a VGAM3078 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3078 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3078 precursor RNA is designated SEQ ID:70051, and is provided hereinbelow with reference to the sequence listing part.

[43053] VGAM3078 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43054] An enzyme complex designated DICER COMPLEX, dices the VGAM3078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3078 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3078 RNA is designated SEQ ID:70052, and is provided hereinbelow with reference to the sequence listing part.

[43055] VGAM3078 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43056] VGAM3078 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3078 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3078 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43057] The complementary binding of VGAM3078 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3078 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3078 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43058] It is appreciated that VGAM3078 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3078 host target genes. The mRNA of each one of this plurality of VGAM3078 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3078 RNA, herein designated VGAM RNA, and which when bound by VGAM3078 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3078 host target proteins.

[43059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3078 gene, herein designated VGAM GENE, on one or more VGAM3078 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43060] It is yet further appreciated that a function of VGAM3078 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3078 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3078 correlate with, and may be deduced from, the identity of the host target genes which VGAM3078 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43061] Nucleotide sequences of the VGAM3078 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3078 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3078 are further described hereinbelow with reference to Table 1.

[43062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3078 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43063] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3079 (VGAM3079) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43064] VGAM3079 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3079 was detected is described hereinabove with reference to Figs. 2-8.

[43065] VGAM3079 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3079 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43066] VGAM3079 gene, herein designated VGAM GENE, encodes a VGAM3079 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3079 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3079 precursor RNA is designated SEQ ID:70061, and is provided hereinbelow with reference to the sequence listing part.

[43067] VGAM3079 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43068] An enzyme complex designated DICER COMPLEX, dices the VGAM3079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3079 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3079 RNA is designated SEQ ID:70062, and is provided hereinbelow with reference to the sequence listing part.

[43069] VGAM3079 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43070] VGAM3079 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3079 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3079 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43071] The complementary binding of VGAM3079 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3079 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3079 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43072] It is appreciated that VGAM3079 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3079 host target genes. The mRNA of each one of this plurality of VGAM3079 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3079 RNA, herein designated VGAM RNA, and which when bound by VGAM3079 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3079 host target proteins.

[43073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3079 gene, herein designated VGAM GENE, on one or more VGAM3079 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43074] It is yet further appreciated that a function of VGAM3079 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3079 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3079 correlate with, and may be deduced from, the identity of the host target genes which VGAM3079 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43075] Nucleotide sequences of the VGAM3079 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3079 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3079 are further described hereinbelow with reference to Table 1.

[43076] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3079 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43077] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3080 (VGAM3080) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43078] VGAM3080 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3080 was detected is described hereinabove with reference to Figs. 2–8.

[43079] VGAM3080 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3080 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43080] VGAM3080 gene, herein designated VGAM GENE, encodes a VGAM3080 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3080 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3080 precursor RNA is designated SEQ ID:70189, and is provided hereinbelow with reference to the sequence listing part.

[43081] VGAM3080 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43082] An enzyme complex designated DICER COMPLEX, dices the VGAM3080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3080 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3080 RNA is designated SEQ ID:70190, and is provided hereinbelow with reference to the sequence listing part.

[43083] VGAM3080 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43084] VGAM3080 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3080 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3080 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43085] The complementary binding of VGAM3080 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3080 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3080 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43086] It is appreciated that VGAM3080 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3080 host target genes. The mRNA of each one of this plurality of VGAM3080 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3080 RNA, herein designated VGAM RNA, and which when bound by VGAM3080 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3080 host target proteins.

[43087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3080 gene, herein designated VGAM GENE, on one or more VGAM3080 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[43088] It is yet further appreciated that a function of VGAM3080 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3080 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3080 correlate with, and may be deduced from, the identity of the host target genes which VGAM3080 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43089] Nucleotide sequences of the VGAM3080 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3080 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3080 are further described hereinbelow with reference to Table 1.

[43090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3080 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43091] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3081 (VGAM3081) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43092] VGAM3081 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3081 was detected is described hereinabove with reference to Figs. 2-8.

[43093] VGAM3081 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3081 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43094] VGAM3081 gene, herein designated VGAM GENE, encodes a VGAM3081 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3081 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3081 precursor RNA is designated SEQ ID:70197, and is provided hereinbelow with reference to the sequence listing part.

[43095] VGAM3081 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43096] An enzyme complex designated DICER COMPLEX, dices the VGAM3081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3081 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3081 RNA is designated SEQ ID:70198, and is provided hereinbelow with reference to the sequence listing part.

[43097] VGAM3081 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43098] VGAM3081 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3081 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3081 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43099] The complementary binding of VGAM3081 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3081 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3081 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43100] It is appreciated that VGAM3081 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3081 host target genes. The mRNA of

each one of this plurality of VGAM3081 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3081 RNA, herein designated VGAM RNA, and which when bound by VGAM3081 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3081 host target proteins.

[43101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3081 gene, herein designated VGAM GENE, on one or more VGAM3081 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[43102] It is yet further appreciated that a function of VGAM3081 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3081 include diagnosis, prevention and treatment of viral infection by *Paramecium bursaria* Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3081 correlate with, and may be deduced from, the identity of the host target genes which VGAM3081 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43103] Nucleotide sequences of the VGAM3081 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3081 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3081 are further described hereinbelow with reference to Table 1.

[43104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3081 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[43105] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3082 (VGAM3082) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43106] VGAM3082 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3082 was detected is described hereinabove with reference to Figs. 2–8.

[43107] VGAM3082 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3082 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43108] VGAM3082 gene, herein designated VGAM GENE, encodes a VGAM3082 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3082 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3082 precursor RNA is designated SEQ ID:70213, and is provided hereinbelow with reference to the sequence listing part.

[43109] VGAM3082 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43110] An enzyme complex designated DICER COMPLEX, dices the VGAM3082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3082 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3082 RNA is designated SEQ ID:70214,

and is provided hereinbelow with reference to the sequence listing part.

[43111] VGAM3082 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43112] VGAM3082 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3082 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3082 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43113] The complementary binding of VGAM3082 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3082 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3082 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43114] It is appreciated that VGAM3082 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3082 host target genes. The mRNA of each one of this plurality of VGAM3082 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3082 RNA, herein designated VGAM RNA, and which when bound by VGAM3082 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3082 host target proteins.

[43115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3082 gene, herein designated VGAM GENE, on one or more VGAM3082 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43116] It is yet further appreciated that a function of VGAM3082 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3082 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3082 correlate with, and may be deduced from, the identity of the host target genes which VGAM3082 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43117] Nucleotide sequences of the VGAM3082 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3082 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3082 are further described hereinbelow with reference to Table 1.

[43118] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3082 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43119] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3083 (VGAM3083) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43120] VGAM3083 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3083 was detected is described hereinabove with reference to Figs. 2–8.

[43121] VGAM3083 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3083 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43122] VGAM3083 gene, herein designated VGAM GENE, encodes a VGAM3083 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3083 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3083 precu-

sor RNA is designated SEQ ID:70226, and is provided hereinbelow with reference to the sequence listing part.

[43123] VGAM3083 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43124] An enzyme complex designated DICER COMPLEX, dices the VGAM3083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3083 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3083 RNA is designated SEQ ID:70227, and is provided hereinbelow with reference to the se-

quence listing part.

[43125] VGAM3083 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43126] VGAM3083 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3083 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3083 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43127] The complementary binding of VGAM3083 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3083 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3083 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43128] It is appreciated that VGAM3083 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3083 host target genes. The mRNA of each one of this plurality of VGAM3083 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3083 RNA, herein designated VGAM RNA, and which when bound by VGAM3083 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3083 host target proteins.

[43129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3083 gene, herein designated VGAM GENE, on one or more VGAM3083 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43130] It is yet further appreciated that a function of VGAM3083

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3083 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3083 correlate with, and may be deduced from, the identity of the host target genes which VGAM3083 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43131] Nucleotide sequences of the VGAM3083 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3083 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3083 are further described hereinbelow with reference to Table 1.

[43132] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3083 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43133] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3084 (VGAM3084) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43134] VGAM3084 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3084 was detected is described hereinabove with reference to Figs. 2–8.

[43135] VGAM3084 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3084 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43136] VGAM3084 gene, herein designated VGAM GENE, encodes a VGAM3084 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3084 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3084 precursor RNA is designated SEQ ID:70238, and is provided

hereinbelow with reference to the sequence listing part.

[43137] VGAM3084 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43138] An enzyme complex designated DICER COMPLEX, dices the VGAM3084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3084 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3084 RNA is designated SEQ ID:70239, and is provided hereinbelow with reference to the sequence listing part.

[43139] VGAM3084 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43140] VGAM3084 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3084 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3084 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43141] The complementary binding of VGAM3084 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3084 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3084 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43142] It is appreciated that VGAM3084 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3084 host target genes. The mRNA of each one of this plurality of VGAM3084 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3084 RNA, herein designated VGAM RNA, and which when bound by VGAM3084 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3084 host target proteins.

[43143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3084 gene, herein designated VGAM GENE, on one or more VGAM3084 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43144] It is yet further appreciated that a function of VGAM3084 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3084 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3084 correlate with, and may be deduced from, the identity of the host target genes which VGAM3084 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43145] Nucleotide sequences of the VGAM3084 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3084 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3084 are further described hereinbelow with reference to Table 1.

[43146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3084 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43147] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3085 (VGAM3085) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43148] VGAM3085 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3085 was detected is described hereinabove with reference to Figs. 2–8.

[43149] VGAM3085 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus A. VGAM3085 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43150] VGAM3085 gene, herein designated VGAM GENE, encodes a VGAM3085 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3085 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3085 precursor RNA is designated SEQ ID:70277, and is provided hereinbelow with reference to the sequence listing part.

[43151] VGAM3085 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43152] An enzyme complex designated DICER COMPLEX, dices the VGAM3085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3085 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3085 RNA is designated SEQ ID:70278, and is provided hereinbelow with reference to the sequence listing part.

[43153] VGAM3085 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43154] VGAM3085 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3085 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3085 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43155] The complementary binding of VGAM3085 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3085 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3085 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43156] It is appreciated that VGAM3085 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3085 host target genes. The mRNA of each one of this plurality of VGAM3085 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3085 RNA, herein designated VGAM

RNA, and which when bound by VGAM3085 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3085 host target proteins.

[43157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3085 gene, herein designated VGAM GENE, on one or more VGAM3085 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43158] It is yet further appreciated that a function of VGAM3085 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3085 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus A. Specific functions, and accordingly utilities, of VGAM3085 correlate with, and may be deduced from, the identity of the host target genes which VGAM3085 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43159] Nucleotide sequences of the VGAM3085 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3085 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3085 are further described hereinbelow with reference to Table 1.

[43160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3085 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43161] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3086 (VGAM3086) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43162] VGAM3086 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3086 was detected is described hereinabove with reference to Figs. 2–8.

[43163] VGAM3086 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3086 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43164] VGAM3086 gene, herein designated VGAM GENE, encodes a VGAM3086 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3086 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3086 precursor RNA is designated SEQ ID:70322, and is provided hereinbelow with reference to the sequence listing part.

[43165] VGAM3086 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43166] An enzyme complex designated DICER COMPLEX, dices the VGAM3086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3086 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3086 RNA is designated SEQ ID:70323, and is provided hereinbelow with reference to the sequence listing part.

[43167] VGAM3086 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3086 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3086 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43168] VGAM3086 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3086 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3086 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3086 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3086 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43169] The complementary binding of VGAM3086 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3086 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3086 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3086 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43170] It is appreciated that VGAM3086 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3086 host target genes. The mRNA of each one of this plurality of VGAM3086 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3086 RNA, herein designated VGAM RNA, and which when bound by VGAM3086 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3086 host target proteins.

[43171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3086 gene, herein designated VGAM GENE, on one or more VGAM3086 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43172] It is yet further appreciated that a function of VGAM3086 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3086 include diagnosis, prevention and

treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3086 correlate with, and may be deduced from, the identity of the host target genes which VGAM3086 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43173] Nucleotide sequences of the VGAM3086 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3086 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3086 are further described hereinbelow with reference to Table 1.

[43174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3086 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43175] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3087 (VGAM3087) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43176] VGAM3087 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3087 was detected is described hereinabove with reference to Figs. 2–8.

[43177] VGAM3087 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3087 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43178] VGAM3087 gene, herein designated VGAM GENE, encodes a VGAM3087 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3087 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3087 precursor RNA is designated SEQ ID:70329, and is provided hereinbelow with reference to the sequence listing part.

[43179] VGAM3087 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3087 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43180] An enzyme complex designated DICER COMPLEX, dices the VGAM3087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3087 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3087 RNA is designated SEQ ID:70330, and is provided hereinbelow with reference to the sequence listing part.

[43181] VGAM3087 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3087 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3087 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43182] VGAM3087 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3087 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3087 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3087 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3087 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43183] The complementary binding of VGAM3087 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3087 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3087 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3087 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43184] It is appreciated that VGAM3087 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3087 host target genes. The mRNA of each one of this plurality of VGAM3087 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3087 RNA, herein designated VGAM RNA, and which when bound by VGAM3087 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3087 host target proteins.

[43185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3087 gene, herein designated VGAM GENE, on one or more VGAM3087 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43186] It is yet further appreciated that a function of VGAM3087 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3087 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM3087 correlate with, and may be deduced from, the identity of the host target genes which VGAM3087 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43187] Nucleotide sequences of the VGAM3087 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3087 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3087 are further described hereinbelow with reference to Table 1.

[43188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3087 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43189] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3088 (VGAM3088) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[43190] VGAM3088 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3088 was detected is described hereinabove with reference to Figs. 2–8.

[43191] VGAM3088 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM3088 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43192] VGAM3088 gene, herein designated VGAM GENE, encodes a VGAM3088 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3088 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3088 precursor RNA is designated SEQ ID:70335, and is provided hereinbelow with reference to the sequence listing part.

[43193] VGAM3088 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3088 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43194] An enzyme complex designated DICER COMPLEX, dices the VGAM3088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3088 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3088 RNA is designated SEQ ID:70336, and is provided hereinbelow with reference to the sequence listing part.

[43195] VGAM3088 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3088 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3088 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43196] VGAM3088 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3088 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3088 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3088 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3088 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43197] The complementary binding of VGAM3088 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3088 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3088 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3088 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43198] It is appreciated that VGAM3088 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3088 host target genes. The mRNA of each one of this plurality of VGAM3088 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3088 RNA, herein designated VGAM RNA, and which when bound by VGAM3088 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3088 host target proteins.

[43199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3088 gene, herein designated VGAM GENE, on one or more VGAM3088 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43200] It is yet further appreciated that a function of VGAM3088 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3088 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of

VGAM3088 correlate with, and may be deduced from, the identity of the host target genes which VGAM3088 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43201] Nucleotide sequences of the VGAM3088 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3088 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3088 are further described hereinbelow with reference to Table 1.

[43202] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3088 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43203] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3089 (VGAM3089) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[43204] VGAM3089 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3089 was detected is described hereinabove with reference to Figs. 2–8.

[43205] VGAM3089 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM3089 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43206] VGAM3089 gene, herein designated VGAM GENE, encodes a VGAM3089 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3089 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3089 precursor RNA is designated SEQ ID:70344, and is provided hereinbelow with reference to the sequence listing part.

[43207] VGAM3089 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43208] An enzyme complex designated DICER COMPLEX, dices the VGAM3089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3089 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3089 RNA is designated SEQ ID:70345, and is provided hereinbelow with reference to the sequence listing part.

[43209] VGAM3089 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43210] VGAM3089 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3089 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3089 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43211] The complementary binding of VGAM3089 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3089 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3089 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43212] It is appreciated that VGAM3089 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3089 host target genes. The mRNA of each one of this plurality of VGAM3089 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3089 RNA, herein designated VGAM RNA, and which when bound by VGAM3089 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3089 host target proteins.

[43213] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3089 gene, herein designated VGAM GENE, on one or more VGAM3089 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43214] It is yet further appreciated that a function of VGAM3089 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3089 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3089 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3089 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43215] Nucleotide sequences of the VGAM3089 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3089 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3089 are further described hereinbelow with reference to Table 1.

[43216] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3089 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43217] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3090 (VGAM3090) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43218] VGAM3090 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3090 was detected is described hereinabove with reference to Figs. 2–8.

[43219] VGAM3090 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3090 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43220] VGAM3090 gene, herein designated VGAM GENE, encodes a VGAM3090 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3090 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3090 precursor RNA is designated SEQ ID:70353, and is provided hereinbelow with reference to the sequence listing part.

[43221] VGAM3090 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43222] An enzyme complex designated DICER COMPLEX, dices the VGAM3090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3090 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3090 RNA is designated SEQ ID:70354, and is provided hereinbelow with reference to the sequence listing part.

[43223] VGAM3090 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43224] VGAM3090 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3090 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3090 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43225] The complementary binding of VGAM3090 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3090 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3090 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43226] It is appreciated that VGAM3090 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3090 host target genes. The mRNA of each one of this plurality of VGAM3090 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3090 RNA, herein designated VGAM RNA, and which when bound by VGAM3090 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3090 host target proteins.

[43227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3090 gene, herein designated VGAM GENE, on one or more VGAM3090 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43228] It is yet further appreciated that a function of VGAM3090 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3090 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3090 correlate with, and may be deduced from, the identity of the host target genes which VGAM3090 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43229] Nucleotide sequences of the VGAM3090 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3090 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3090 are further described hereinbelow with reference to Table 1.

[43230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3090 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43231] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3091 (VGAM3091) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43232] VGAM3091 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3091 was detected is described hereinabove with reference to Figs. 2–8.

[43233] VGAM3091 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM3091 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43234] VGAM3091 gene, herein designated VGAM GENE, encodes a VGAM3091 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3091 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3091 precursor RNA is designated SEQ ID:70366, and is provided hereinbelow with reference to the sequence listing part.

[43235] VGAM3091 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43236] An enzyme complex designated DICER COMPLEX, dices the VGAM3091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3091 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3091 RNA is designated SEQ ID:70367, and is provided hereinbelow with reference to the sequence listing part.

[43237] VGAM3091 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43238] VGAM3091 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3091 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3091 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[43239] The complementary binding of VGAM3091 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3091 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3091 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43240] It is appreciated that VGAM3091 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3091 host target genes. The mRNA of each one of this plurality of VGAM3091 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3091 RNA, herein designated VGAM RNA, and which when bound by VGAM3091 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3091 host target proteins.

[43241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3091 gene, herein designated VGAM GENE, on one or more VGAM3091 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43242] It is yet further appreciated that a function of VGAM3091 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3091 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM3091 correlate with, and may be deduced from, the identity of the host target genes which VGAM3091 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[43243] Nucleotide sequences of the VGAM3091 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3091 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3091 are further described hereinbelow with reference to Table 1.

[43244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3091 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43245] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3092 (VGAM3092) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43246] VGAM3092 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3092 was detected is described hereinabove with reference to Figs. 2–8.

[43247] VGAM3092 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM3092 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43248] VGAM3092 gene, herein designated VGAM GENE, encodes a VGAM3092 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3092 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3092 precursor RNA is designated SEQ ID:70376, and is provided hereinbelow with reference to the sequence listing part.

[43249] VGAM3092 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43250] An enzyme complex designated DICER COMPLEX, dices the VGAM3092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3092 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3092 RNA is designated SEQ ID:70377, and is provided hereinbelow with reference to the sequence listing part.

[43251] VGAM3092 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[43252] VGAM3092 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3092 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3092 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43253] The complementary binding of VGAM3092 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3092 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3092 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43254] It is appreciated that VGAM3092 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3092 host target genes. The mRNA of each one of this plurality of VGAM3092 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3092 RNA, herein designated VGAM RNA, and which when bound by VGAM3092 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3092 host target proteins.

[43255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3092 gene, herein designated VGAM GENE, on one

or more VGAM3092 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43256] It is yet further appreciated that a function of VGAM3092 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3092 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM3092 correlate with, and may be deduced from, the identity of the host target genes which VGAM3092 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43257] Nucleotide sequences of the VGAM3092 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3092 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3092 are further described hereinbelow with reference to Table 1.

[43258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3092 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43259] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3093 (VGAM3093) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43260] VGAM3093 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3093 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[43261] VGAM3093 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus Y.

VGAM3093 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43262] VGAM3093 gene, herein designated VGAM GENE, encodes a VGAM3093 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3093 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3093 precursor RNA is designated SEQ ID:70382, and is provided hereinbelow with reference to the sequence listing part.

[43263] VGAM3093 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43264] An enzyme complex designated DICER COMPLEX, dices the VGAM3093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3093 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3093 RNA is designated SEQ ID:70383, and is provided hereinbelow with reference to the sequence listing part.

[43265] VGAM3093 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43266] VGAM3093 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3093 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3093 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43267] The complementary binding of VGAM3093 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3093 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3093 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43268] It is appreciated that VGAM3093 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3093 host target genes. The mRNA of each one of this plurality of VGAM3093 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3093 RNA, herein designated VGAM RNA, and which when bound by VGAM3093 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3093 host target proteins.

[43269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3093 gene, herein designated VGAM GENE, on one or more VGAM3093 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43270] It is yet further appreciated that a function of VGAM3093 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3093 include diagnosis, prevention and treatment of viral infection by Potato virus Y. Specific functions, and accordingly utilities, of VGAM3093 correlate with, and may be deduced from, the identity of the host target genes which VGAM3093 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43271] Nucleotide sequences of the VGAM3093 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3093 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3093 are further described hereinbelow with reference to Table 1.

[43272] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3093 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43273] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3094 (VGAM3094) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43274] VGAM3094 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3094 was detected is described hereinabove with reference to Figs. 2-8.

[43275] VGAM3094 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus Y.

VGAM3094 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43276] VGAM3094 gene, herein designated VGAM GENE, encodes a VGAM3094 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3094 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3094 precursor RNA is designated SEQ ID:70393, and is provided hereinbelow with reference to the sequence listing part.

[43277] VGAM3094 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[43278] An enzyme complex designated DICER COMPLEX, dices the VGAM3094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3094 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3094 RNA is designated SEQ ID:70394, and is provided hereinbelow with reference to the sequence listing part.

[43279] VGAM3094 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43280] VGAM3094 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3094 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3094 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43281] The complementary binding of VGAM3094 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3094 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3094 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43282] It is appreciated that VGAM3094 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3094 host target genes. The mRNA of each one of this plurality of VGAM3094 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3094 RNA, herein designated VGAM RNA, and which when bound by VGAM3094 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3094 host target proteins.

[43283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3094 gene, herein designated VGAM GENE, on one or more VGAM3094 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43284] It is yet further appreciated that a function of VGAM3094 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3094 include diagnosis, prevention and treatment of viral infection by Potato virus Y. Specific functions, and accordingly utilities, of VGAM3094 correlate with, and may be deduced from, the identity of the host target genes which VGAM3094 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43285] Nucleotide sequences of the VGAM3094 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3094 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3094 are further described hereinbelow with reference to Table 1.

[43286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3094 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43287] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3095 (VGAM3095) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43288] VGAM3095 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3095 was detected is described hereinabove with reference to Figs. 2-8.

[43289] VGAM3095 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3095 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43290] VGAM3095 gene, herein designated VGAM GENE, encodes a VGAM3095 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3095 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3095 precursor RNA is designated SEQ ID:70402, and is provided hereinbelow with reference to the sequence listing part.

[43291] VGAM3095 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43292] An enzyme complex designated DICER COMPLEX, dices the VGAM3095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3095 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3095 RNA is designated SEQ ID:70403, and is provided hereinbelow with reference to the sequence listing part.

[43293] VGAM3095 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3095 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3095 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43294] VGAM3095 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3095 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3095 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3095 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3095 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43295] The complementary binding of VGAM3095 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3095 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3095 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3095 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43296] It is appreciated that VGAM3095 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3095 host target genes. The mRNA of each one of this plurality of VGAM3095 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3095 RNA, herein designated VGAM RNA, and which when bound by VGAM3095 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3095 host target proteins.

[43297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3095 gene, herein designated VGAM GENE, on one or more VGAM3095 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43298] It is yet further appreciated that a function of VGAM3095 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3095 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3095 correlate with, and may be deduced from, the identity of the host target genes which VGAM3095 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43299] Nucleotide sequences of the VGAM3095 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3095 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3095 are further described hereinbelow with reference to Table 1.

[43300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3095 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43301] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3096 (VGAM3096) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43302] VGAM3096 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3096 was detected is described hereinabove with reference to Figs. 2-8.

[43303] VGAM3096 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and

kidney necrosis virus. VGAM3096 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43304] VGAM3096 gene, herein designated VGAM GENE, encodes a VGAM3096 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3096 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3096 precursor RNA is designated SEQ ID:70420, and is provided hereinbelow with reference to the sequence listing part.

[43305] VGAM3096 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43306] An enzyme complex designated DICER COMPLEX, dices

the VGAM3096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3096 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3096 RNA is designated SEQ ID:70421, and is provided hereinbelow with reference to the sequence listing part.

[43307] VGAM3096 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3096 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3096 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43308] VGAM3096 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3096 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3096 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3096 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3096 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43309] The complementary binding of VGAM3096 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3096 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3096 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3096 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43310] It is appreciated that VGAM3096 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3096 host target genes. The mRNA of each one of this plurality of VGAM3096 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3096 RNA, herein designated VGAM RNA, and which when bound by VGAM3096 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3096 host target proteins.

[43311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3096 gene, herein designated VGAM GENE, on one or more VGAM3096 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43312] It is yet further appreciated that a function of VGAM3096 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3096 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3096 correlate with, and may be deduced from, the identity of the host target genes which VGAM3096 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43313] Nucleotide sequences of the VGAM3096 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3096 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3096 are further described hereinbelow with reference to Table 1.

[43314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3096 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43315] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3097 (VGAM3097) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43316] VGAM3097 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3097 was detected is described hereinabove with reference to Figs. 2-8.

[43317] VGAM3097 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3097 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43318] VGAM3097 gene, herein designated VGAM GENE, encodes a VGAM3097 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3097 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3097 precursor RNA is designated SEQ ID:70428, and is provided hereinbelow with reference to the sequence listing part.

[43319] VGAM3097 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43320] An enzyme complex designated DICER COMPLEX, dices the VGAM3097 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3097 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3097 RNA is designated SEQ ID:70429, and is provided hereinbelow with reference to the sequence listing part.

[43321] VGAM3097 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3097 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3097 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43322] VGAM3097 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3097 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3097 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3097 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3097 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43323] The complementary binding of VGAM3097 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3097 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3097

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3097 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43324] It is appreciated that VGAM3097 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3097 host target genes. The mRNA of each one of this plurality of VGAM3097 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3097 RNA, herein designated VGAM RNA, and which when bound by VGAM3097 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3097 host target proteins.

[43325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3097 gene, herein designated VGAM GENE, on one or more VGAM3097 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43326] It is yet further appreciated that a function of VGAM3097 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3097 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3097 correlate with, and may be deduced from, the identity of the host target genes which VGAM3097 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43327] Nucleotide sequences of the VGAM3097 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3097 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3097 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3097 are further described hereinbelow with reference to Table 1.

[43328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3097 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43329] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3098 (VGAM3098) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43330] VGAM3098 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3098 was detected is described hereinabove with reference to Figs. 2-8.

[43331] VGAM3098 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3098 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[43332] VGAM3098 gene, herein designated VGAM GENE, encodes a VGAM3098 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3098 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3098 precursor RNA is designated SEQ ID:70441, and is provided hereinbelow with reference to the sequence listing part.

[43333] VGAM3098 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43334] An enzyme complex designated DICER COMPLEX, dices the VGAM3098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3098 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3098 RNA is designated SEQ ID:70442, and is provided hereinbelow with reference to the sequence listing part.

[43335] VGAM3098 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3098 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3098 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43336] VGAM3098 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3098 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3098 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3098 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3098 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43337] The complementary binding of VGAM3098 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3098 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3098 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3098 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43338] It is appreciated that VGAM3098 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3098 host target genes. The mRNA of each one of this plurality of VGAM3098 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3098 RNA, herein designated VGAM RNA, and which when bound by VGAM3098 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3098 host target proteins.

[43339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3098 gene, herein designated VGAM GENE, on one or more VGAM3098 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43340] It is yet further appreciated that a function of VGAM3098 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3098 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3098 correlate with, and may be deduced from, the identity of the host target genes which VGAM3098 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43341] Nucleotide sequences of the VGAM3098 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3098 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3098 are further

described hereinbelow with reference to Table 1.

[43342] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3098 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43343] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3099 (VGAM3099) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43344] VGAM3099 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3099 was detected is described hereinabove with reference to Figs. 2-8.

[43345] VGAM3099 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3099 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43346] VGAM3099 gene, herein designated VGAM GENE, encodes a VGAM3099 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3099 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3099 precursor RNA is designated SEQ ID:70489, and is provided hereinbelow with reference to the sequence listing part.

[43347] VGAM3099 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43348] An enzyme complex designated DICER COMPLEX, dices the VGAM3099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3099 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3099 RNA is designated SEQ ID:70490, and is provided hereinbelow with reference to the sequence listing part.

[43349] VGAM3099 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43350] VGAM3099 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3099 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3099 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43351] The complementary binding of VGAM3099 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3099 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3099 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43352] It is appreciated that VGAM3099 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3099 host target genes. The mRNA of each one of this plurality of VGAM3099 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3099 RNA, herein designated VGAM RNA, and which when bound by VGAM3099 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3099 host target proteins.

[43353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3099 gene, herein designated VGAM GENE, on one or more VGAM3099 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43354] It is yet further appreciated that a function of VGAM3099 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3099 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3099 correlate with, and may be deduced from, the identity of the host target genes which VGAM3099 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43355] Nucleotide sequences of the VGAM3099 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3099 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3099 are further described hereinbelow with reference to Table 1.

[43356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3099 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43357] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3100 (VGAM3100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43358] VGAM3100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3100 was detected is described hereinabove with reference to Figs. 2-8.

[43359] VGAM3100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43360] VGAM3100 gene, herein designated VGAM GENE, encodes

a VGAM3100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3100 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3100 precursor RNA is designated SEQ ID:70520, and is provided hereinbelow with reference to the sequence listing part.

[43361] VGAM3100 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43362] An enzyme complex designated DICER COMPLEX, dices the VGAM3100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3100 RNA is designated SEQ ID:70521, and is provided hereinbelow with reference to the sequence listing part.

[43363] VGAM3100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43364] VGAM3100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3100 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43365] The complementary binding of VGAM3100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3100 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[43366] It is appreciated that VGAM3100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3100 host target genes. The mRNA of each one of this plurality of VGAM3100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3100 RNA, herein designated VGAM RNA, and which when bound by VGAM3100 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3100 host target proteins.

[43367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3100 gene, herein designated VGAM GENE, on one or more VGAM3100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43368] It is yet further appreciated that a function of VGAM3100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3100 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3100 correlate with, and may be deduced from, the identity of the host target genes which VGAM3100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43369] Nucleotide sequences of the VGAM3100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3100 are further described hereinbelow with reference to Table 1.

[43370] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43371] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3101 (VGAM3101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43372] VGAM3101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3101 was detected is described hereinabove with reference to Figs. 2-8.

[43373] VGAM3101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43374] VGAM3101 gene, herein designated VGAM GENE, encodes a VGAM3101 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3101 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3101 precursor RNA is designated SEQ ID:70536, and is provided hereinbelow with reference to the sequence listing part.

[43375] VGAM3101 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43376] An enzyme complex designated DICER COMPLEX, dices the VGAM3101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3101 RNA is designated SEQ ID:70537, and is provided hereinbelow with reference to the sequence listing part.

[43377] VGAM3101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43378] VGAM3101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3101 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43379] The complementary binding of VGAM3101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3101 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43380] It is appreciated that VGAM3101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3101 host target genes. The mRNA of each one of this plurality of VGAM3101 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3101 RNA, herein designated VGAM RNA, and which when bound by VGAM3101 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3101 host target proteins.

[43381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3101 gene, herein designated VGAM GENE, on one or more VGAM3101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43382] It is yet further appreciated that a function of VGAM3101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3101 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3101 correlate with, and may be deduced from, the identity of the host target genes which VGAM3101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43383] Nucleotide sequences of the VGAM3101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3101 are further described hereinbelow with reference to Table 1.

[43384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43385] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3102 (VGAM3102) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43386] VGAM3102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3102 was detected is described hereinabove with reference to Figs. 2-8.

[43387] VGAM3102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43388] VGAM3102 gene, herein designated VGAM GENE, encodes a VGAM3102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3102 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3102 precursor RNA is designated SEQ ID:70543, and is provided hereinbelow with reference to the sequence listing part.

[43389] VGAM3102 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43390] An enzyme complex designated DICER COMPLEX, dices the VGAM3102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3102 RNA is designated SEQ ID:70544, and is provided hereinbelow with reference to the sequence listing part.

[43391] VGAM3102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43392] VGAM3102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3102 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43393] The complementary binding of VGAM3102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3102 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43394] It is appreciated that VGAM3102 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3102 host target genes. The mRNA of each one of this plurality of VGAM3102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3102 RNA, herein designated VGAM RNA, and which when bound by VGAM3102 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3102 host target proteins.

[43395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3102 gene, herein designated VGAM GENE, on one or more VGAM3102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43396] It is yet further appreciated that a function of VGAM3102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3102 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3102 correlate with, and may be deduced from, the identity of the host target genes which VGAM3102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43397] Nucleotide sequences of the VGAM3102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3102 are further described hereinbelow with reference to Table 1.

[43398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43399] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3103 (VGAM3103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43400] VGAM3103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3103 was detected is described hereinabove with reference to Figs. 2–8.

[43401] VGAM3103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43402] VGAM3103 gene, herein designated VGAM GENE, encodes a VGAM3103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3103 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3103 precursor RNA is designated SEQ ID:70703, and is provided hereinbelow with reference to the sequence listing part.

[43403] VGAM3103 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43404] An enzyme complex designated DICER COMPLEX, dices the VGAM3103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3103 RNA is designated SEQ ID:70704, and is provided hereinbelow with reference to the sequence listing part.

[43405] VGAM3103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43406] VGAM3103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3103 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43407] The complementary binding of VGAM3103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3103 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43408] It is appreciated that VGAM3103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3103 host target genes. The mRNA of each one of this plurality of VGAM3103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3103 RNA, herein designated VGAM RNA, and which when bound by VGAM3103 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3103 host target proteins.

[43409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3103 gene, herein designated VGAM GENE, on one or more VGAM3103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[43410] It is yet further appreciated that a function of VGAM3103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3103 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3103 correlate with, and may be deduced from, the identity of the host target genes which VGAM3103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43411] Nucleotide sequences of the VGAM3103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3103 are further described hereinbelow with reference to Table 1.

[43412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43413] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3104 (VGAM3104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43414] VGAM3104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3104 was detected is described hereinabove with reference to Figs. 2-8.

[43415] VGAM3104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43416] VGAM3104 gene, herein designated VGAM GENE, encodes a VGAM3104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3104 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3104 precursor RNA is designated SEQ ID:70733, and is provided hereinbelow with reference to the sequence listing part.

[43417] VGAM3104 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43418] An enzyme complex designated DICER COMPLEX, dices the VGAM3104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3104 RNA is designated SEQ ID:70734, and is provided hereinbelow with reference to the sequence listing part.

[43419] VGAM3104 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43420] VGAM3104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3104 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3104 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43421] The complementary binding of VGAM3104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3104 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43422] It is appreciated that VGAM3104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3104 host target genes. The mRNA of

each one of this plurality of VGAM3104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3104 RNA, herein designated VGAM RNA, and which when bound by VGAM3104 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3104 host target proteins.

[43423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3104 gene, herein designated VGAM GENE, on one or more VGAM3104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[43424] It is yet further appreciated that a function of VGAM3104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3104 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3104 correlate with, and may be deduced from, the identity of the host target genes which VGAM3104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43425] Nucleotide sequences of the VGAM3104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3104 are further described hereinbelow with reference to Table 1.

[43426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3104 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[43427] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3105 (VGAM3105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43428] VGAM3105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3105 was detected is described hereinabove with reference to Figs. 2–8.

[43429] VGAM3105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43430] VGAM3105 gene, herein designated VGAM GENE, encodes a VGAM3105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3105 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3105 precursor RNA is designated SEQ ID:70769, and is provided hereinbelow with reference to the sequence listing part.

[43431] VGAM3105 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43432] An enzyme complex designated DICER COMPLEX, dices the VGAM3105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3105 RNA is designated SEQ ID:70770,

and is provided hereinbelow with reference to the sequence listing part.

[43433] VGAM3105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43434] VGAM3105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3105 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43435] The complementary binding of VGAM3105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3105 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43436] It is appreciated that VGAM3105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3105 host target genes. The mRNA of each one of this plurality of VGAM3105 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3105 RNA, herein designated VGAM RNA, and which when bound by VGAM3105 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3105 host target proteins.

[43437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3105 gene, herein designated VGAM GENE, on one or more VGAM3105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43438] It is yet further appreciated that a function of VGAM3105 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3105 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3105 correlate with, and may be deduced from, the identity of the host target genes which VGAM3105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43439] Nucleotide sequences of the VGAM3105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3105 are further described hereinbelow with reference to Table 1.

[43440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43441] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3106 (VGAM3106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43442] VGAM3106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3106 was detected is described hereinabove with reference to Figs. 2–8.

[43443] VGAM3106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus C. VGAM3106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43444] VGAM3106 gene, herein designated VGAM GENE, encodes a VGAM3106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3106 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3106 precu-

sor RNA is designated SEQ ID:70774, and is provided hereinbelow with reference to the sequence listing part.

[43445] VGAM3106 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43446] An enzyme complex designated DICER COMPLEX, dices the VGAM3106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3106 RNA is designated SEQ ID:70775, and is provided hereinbelow with reference to the se-

quence listing part.

[43447] VGAM3106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43448] VGAM3106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3106 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43449] The complementary binding of VGAM3106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3106 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43450] It is appreciated that VGAM3106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3106 host target genes. The mRNA of each one of this plurality of VGAM3106 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3106 RNA, herein designated VGAM RNA, and which when bound by VGAM3106 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3106 host target proteins.

[43451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3106 gene, herein designated VGAM GENE, on one or more VGAM3106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43452] It is yet further appreciated that a function of VGAM3106

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3106 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus C. Specific functions, and accordingly utilities, of VGAM3106 correlate with, and may be deduced from, the identity of the host target genes which VGAM3106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43453] Nucleotide sequences of the VGAM3106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3106 are further described hereinbelow with reference to Table 1.

[43454] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43455] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3107 (VGAM3107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43456] VGAM3107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3107 was detected is described hereinabove with reference to Figs. 2–8.

[43457] VGAM3107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43458] VGAM3107 gene, herein designated VGAM GENE, encodes a VGAM3107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3107 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3107 precursor RNA is designated SEQ ID:70789, and is provided

hereinbelow with reference to the sequence listing part.

[43459] VGAM3107 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43460] An enzyme complex designated DICER COMPLEX, dices the VGAM3107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3107 RNA is designated SEQ ID:70790, and is provided hereinbelow with reference to the sequence listing part.

[43461] VGAM3107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43462] VGAM3107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3107 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3107 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43463] The complementary binding of VGAM3107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3107 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43464] It is appreciated that VGAM3107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3107 host target genes. The mRNA of each one of this plurality of VGAM3107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3107 RNA, herein designated VGAM RNA, and which when bound by VGAM3107 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3107 host target proteins.

[43465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3107 gene, herein designated VGAM GENE, on one or more VGAM3107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43466] It is yet further appreciated that a function of VGAM3107 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3107 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3107 correlate with, and may be deduced from, the identity of the host target genes which VGAM3107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43467] Nucleotide sequences of the VGAM3107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3107 are further described hereinbelow with reference to Table 1.

[43468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43469] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3108 (VGAM3108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43470] VGAM3108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3108 was detected is described hereinabove with reference to Figs. 2–8.

[43471] VGAM3108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43472] VGAM3108 gene, herein designated VGAM GENE, encodes a VGAM3108 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3108 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3108 precursor RNA is designated SEQ ID:70796, and is provided hereinbelow with reference to the sequence listing part.

[43473] VGAM3108 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43474] An enzyme complex designated DICER COMPLEX, dices the VGAM3108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3108 RNA is designated SEQ ID:70797, and is provided hereinbelow with reference to the sequence listing part.

[43475] VGAM3108 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43476] VGAM3108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3108 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3108 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43477] The complementary binding of VGAM3108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3108 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43478] It is appreciated that VGAM3108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3108 host target genes. The mRNA of each one of this plurality of VGAM3108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3108 RNA, herein designated VGAM

RNA, and which when bound by VGAM3108 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3108 host target proteins.

[43479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3108 gene, herein designated VGAM GENE, on one or more VGAM3108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43480] It is yet further appreciated that a function of VGAM3108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3108 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3108 correlate with, and may be deduced from, the identity of the host target genes which VGAM3108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43481] Nucleotide sequences of the VGAM3108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3108 are further described hereinbelow with reference to Table 1.

[43482] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3108 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43483] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3109 (VGAM3109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43484] VGAM3109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3109 was detected is described hereinabove with reference to Figs. 2–8.

[43485] VGAM3109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM3109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43486] VGAM3109 gene, herein designated VGAM GENE, encodes a VGAM3109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3109 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3109 precursor RNA is designated SEQ ID:70813, and is provided hereinbelow with reference to the sequence listing part.

[43487] VGAM3109 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43488] An enzyme complex designated DICER COMPLEX, dices the VGAM3109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3109 RNA is designated SEQ ID:70814, and is provided hereinbelow with reference to the sequence listing part.

[43489] VGAM3109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3109 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43490] VGAM3109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3109 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3109 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43491] The complementary binding of VGAM3109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3109 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43492] It is appreciated that VGAM3109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3109 host target genes. The mRNA of each one of this plurality of VGAM3109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3109 RNA, herein designated VGAM RNA, and which when bound by VGAM3109 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3109 host target proteins.

[43493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3109 gene, herein designated VGAM GENE, on one or more VGAM3109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43494] It is yet further appreciated that a function of VGAM3109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3109 include diagnosis, prevention and

treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3109 correlate with, and may be deduced from, the identity of the host target genes which VGAM3109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43495] Nucleotide sequences of the VGAM3109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3109 are further described hereinbelow with reference to Table 1.

[43496] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43497] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3110 (VGAM3110) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43498] VGAM3110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3110 was detected is described hereinabove with reference to Figs. 2–8.

[43499] VGAM3110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43500] VGAM3110 gene, herein designated VGAM GENE, encodes a VGAM3110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3110 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3110 precursor RNA is designated SEQ ID:70818, and is provided hereinbelow with reference to the sequence listing part.

[43501] VGAM3110 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3110 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43502] An enzyme complex designated DICER COMPLEX, dices the VGAM3110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3110 RNA is designated SEQ ID:70770, and is provided hereinbelow with reference to the sequence listing part.

[43503] VGAM3110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3110 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43504] VGAM3110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3110 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43505] The complementary binding of VGAM3110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3110 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43506] It is appreciated that VGAM3110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3110 host target genes. The mRNA of each one of this plurality of VGAM3110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3110 RNA, herein designated VGAM RNA, and which when bound by VGAM3110 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3110 host target proteins.

[43507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3110 gene, herein designated VGAM GENE, on one or more VGAM3110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43508] It is yet further appreciated that a function of VGAM3110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3110 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3110 correlate

with, and may be deduced from, the identity of the host target genes which VGAM3110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43509] Nucleotide sequences of the VGAM3110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3110 are further described hereinbelow with reference to Table 1.

[43510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43511] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3111 (VGAM3111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[43512] VGAM3111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3111 was detected is described hereinabove with reference to Figs. 2–8.

[43513] VGAM3111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine papillomavirus. VGAM3111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43514] VGAM3111 gene, herein designated VGAM GENE, encodes a VGAM3111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3111 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3111 precursor RNA is designated SEQ ID:70819, and is provided hereinbelow with reference to the sequence listing part.

[43515] VGAM3111 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43516] An enzyme complex designated DICER COMPLEX, dices the VGAM3111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3111 RNA is designated SEQ ID:70820, and is provided hereinbelow with reference to the sequence listing part.

[43517] VGAM3111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43518] VGAM3111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3111 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43519] The complementary binding of VGAM3111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3111 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43520] It is appreciated that VGAM3111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3111 host target genes. The mRNA of each one of this plurality of VGAM3111 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3111 RNA, herein designated VGAM RNA, and which when bound by VGAM3111 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3111 host target proteins.

[43521] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3111 gene, herein designated VGAM GENE, on one or more VGAM3111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43522] It is yet further appreciated that a function of VGAM3111 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3111 include diagnosis, prevention and treatment of viral infection by Bovine papillomavirus. Specific functions, and accordingly utilities, of VGAM3111 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43523] Nucleotide sequences of the VGAM3111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3111 are further described hereinbelow with reference to Table 1.

[43524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43525] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3112 (VGAM3112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43526] VGAM3112 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3112 was detected is described hereinabove with reference to Figs. 2–8.

[43527] VGAM3112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM3112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43528] VGAM3112 gene, herein designated VGAM GENE, encodes a VGAM3112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3112 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3112 precursor RNA is designated SEQ ID:70830, and is provided hereinbelow with reference to the sequence listing part.

[43529] VGAM3112 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43530] An enzyme complex designated DICER COMPLEX, dices the VGAM3112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3112 RNA is designated SEQ ID:70831, and is provided hereinbelow with reference to the sequence listing part.

[43531] VGAM3112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43532] VGAM3112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3112 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43533] The complementary binding of VGAM3112 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3112 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43534] It is appreciated that VGAM3112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3112 host target genes. The mRNA of each one of this plurality of VGAM3112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3112 RNA, herein designated VGAM RNA, and which when bound by VGAM3112 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3112 host target proteins.

[43535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3112 gene, herein designated VGAM GENE, on one or more VGAM3112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43536] It is yet further appreciated that a function of VGAM3112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3112 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3112 correlate with, and may be deduced from, the identity of the host target genes which VGAM3112 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[43537] Nucleotide sequences of the VGAM3112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3112 are further described hereinbelow with reference to Table 1.

[43538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43539] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3113 (VGAM3113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43540] VGAM3113 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3113 was detected is described hereinabove with reference to Figs. 2–8.

[43541] VGAM3113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Rana tigrina* ranavirus. VGAM3113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43542] VGAM3113 gene, herein designated VGAM GENE, encodes a VGAM3113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3113 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3113 precursor RNA is designated SEQ ID:70843, and is provided hereinbelow with reference to the sequence listing part.

[43543] VGAM3113 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43544] An enzyme complex designated DICER COMPLEX, dices the VGAM3113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3113 RNA is designated SEQ ID:70844, and is provided hereinbelow with reference to the sequence listing part.

[43545] VGAM3113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43546] VGAM3113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3113 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[43547] The complementary binding of VGAM3113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3113 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3113 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43548] It is appreciated that VGAM3113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3113 host target genes. The mRNA of each one of this plurality of VGAM3113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3113 RNA, herein designated VGAM RNA, and which when bound by VGAM3113 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3113 host target proteins.

[43549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3113 gene, herein designated VGAM GENE, on one or more VGAM3113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43550] It is yet further appreciated that a function of VGAM3113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3113 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM3113 correlate with, and may be deduced from, the identity of the host target genes which VGAM3113 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[43551] Nucleotide sequences of the VGAM3113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3113 are further described hereinbelow with reference to Table 1.

[43552] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3113 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43553] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3114 (VGAM3114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43554] VGAM3114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3114 was detected is described hereinabove with reference to Figs. 2–8.

[43555] VGAM3114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Rana tigrina* ranavirus. VGAM3114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43556] VGAM3114 gene, herein designated VGAM GENE, encodes a VGAM3114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3114 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3114 precursor RNA is designated SEQ ID:70853, and is provided hereinbelow with reference to the sequence listing part.

[43557] VGAM3114 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43558] An enzyme complex designated DICER COMPLEX, dices the VGAM3114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3114 RNA is designated SEQ ID:70854, and is provided hereinbelow with reference to the sequence listing part.

[43559] VGAM3114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[43560] VGAM3114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3114 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43561] The complementary binding of VGAM3114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3114 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43562] It is appreciated that VGAM3114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3114 host target genes. The mRNA of each one of this plurality of VGAM3114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3114 RNA, herein designated VGAM RNA, and which when bound by VGAM3114 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3114 host target proteins.

[43563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3114 gene, herein designated VGAM GENE, on one

or more VGAM3114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43564] It is yet further appreciated that a function of VGAM3114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3114 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM3114 correlate with, and may be deduced from, the identity of the host target genes which VGAM3114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43565] Nucleotide sequences of the VGAM3114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3114 are further described hereinbelow with reference to Table 1.

[43566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43567] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3115 (VGAM3115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43568] VGAM3115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3115 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[43569] VGAM3115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43570] VGAM3115 gene, herein designated VGAM GENE, encodes a VGAM3115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3115 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3115 precursor RNA is designated SEQ ID:70861, and is provided hereinbelow with reference to the sequence listing part.

[43571] VGAM3115 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43572] An enzyme complex designated DICER COMPLEX, dices the VGAM3115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3115 RNA is designated SEQ ID:70862, and is provided hereinbelow with reference to the sequence listing part.

[43573] VGAM3115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43574] VGAM3115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3115 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43575] The complementary binding of VGAM3115 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3115 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43576] It is appreciated that VGAM3115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3115 host target genes. The mRNA of each one of this plurality of VGAM3115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3115 RNA, herein designated VGAM RNA, and which when bound by VGAM3115 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3115 host target proteins.

[43577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3115 gene, herein designated VGAM GENE, on one or more VGAM3115 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43578] It is yet further appreciated that a function of VGAM3115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3115 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3115 correlate with, and may be deduced from, the identity of the host target genes which VGAM3115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43579] Nucleotide sequences of the VGAM3115 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3115 are further described hereinbelow with reference to Table 1.

[43580] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43581] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3116 (VGAM3116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43582] VGAM3116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3116 was detected is described hereinabove with reference to Figs. 2-8.

[43583] VGAM3116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM3116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43584] VGAM3116 gene, herein designated VGAM GENE, encodes a VGAM3116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3116 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3116 precursor RNA is designated SEQ ID:70868, and is provided hereinbelow with reference to the sequence listing part.

[43585] VGAM3116 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[43586] An enzyme complex designated DICER COMPLEX, dices the VGAM3116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3116 RNA is designated SEQ ID:70869, and is provided hereinbelow with reference to the sequence listing part.

[43587] VGAM3116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43588] VGAM3116 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3116 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43589] The complementary binding of VGAM3116 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3116 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43590] It is appreciated that VGAM3116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3116 host target genes. The mRNA of each one of this plurality of VGAM3116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3116 RNA, herein designated VGAM RNA, and which when bound by VGAM3116 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3116 host target proteins.

[43591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3116 gene, herein designated VGAM GENE, on one or more VGAM3116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43592] It is yet further appreciated that a function of VGAM3116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3116 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3116 correlate with, and may be deduced from, the identity of the host target genes which VGAM3116 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43593] Nucleotide sequences of the VGAM3116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3116 are further described hereinbelow with reference to Table 1.

[43594] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43595] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3117 (VGAM3117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43596] VGAM3117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3117 was detected is described hereinabove with reference to Figs. 2-8.

[43597] VGAM3117 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human papillomavirus type 36. VGAM3117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43598] VGAM3117 gene, herein designated VGAM GENE, encodes a VGAM3117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3117 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3117 precursor RNA is designated SEQ ID:70894, and is provided hereinbelow with reference to the sequence listing part.

[43599] VGAM3117 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43600] An enzyme complex designated DICER COMPLEX, dices the VGAM3117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3117 RNA is designated SEQ ID:70895, and is provided hereinbelow with reference to the sequence listing part.

[43601] VGAM3117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3117 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43602] VGAM3117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3117 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43603] The complementary binding of VGAM3117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3117 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3117 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43604] It is appreciated that VGAM3117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3117 host target genes. The mRNA of each one of this plurality of VGAM3117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3117 RNA, herein designated VGAM RNA, and which when bound by VGAM3117 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3117 host target proteins.

[43605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3117 gene, herein designated VGAM GENE, on one or more VGAM3117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43606] It is yet further appreciated that a function of VGAM3117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3117 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 36. Specific functions, and accordingly utilities, of VGAM3117 correlate with, and may be deduced from, the identity of the host target genes which VGAM3117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43607] Nucleotide sequences of the VGAM3117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3117 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3117 are further described hereinbelow with reference to Table 1.

[43608] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43609] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3118 (VGAM3118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43610] VGAM3118 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3118 was detected is described hereinabove with reference to Figs. 2-8.

[43611] VGAM3118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43612] VGAM3118 gene, herein designated VGAM GENE, encodes a VGAM3118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3118 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3118 precursor RNA is designated SEQ ID:70904, and is provided hereinbelow with reference to the sequence listing part.

[43613] VGAM3118 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43614] An enzyme complex designated DICER COMPLEX, dices

the VGAM3118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3118 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3118 RNA is designated SEQ ID:70905, and is provided hereinbelow with reference to the sequence listing part.

[43615] VGAM3118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3118 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43616] VGAM3118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3118 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3118 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43617] The complementary binding of VGAM3118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3118 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43618] It is appreciated that VGAM3118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3118 host target genes. The mRNA of each one of this plurality of VGAM3118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3118 RNA, herein designated VGAM RNA, and which when bound by VGAM3118 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3118 host target proteins.

[43619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3118 gene, herein designated VGAM GENE, on one or more VGAM3118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43620] It is yet further appreciated that a function of VGAM3118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3118 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3118 correlate with, and may be deduced from, the identity of the host target genes which VGAM3118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43621] Nucleotide sequences of the VGAM3118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3118 are further described hereinbelow with reference to Table 1.

[43622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43623] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3119 (VGAM3119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43624] VGAM3119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3119 was detected is described hereinabove with reference to Figs. 2-8.

[43625] VGAM3119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM3119 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[43626] VGAM3119 gene, herein designated VGAM GENE, encodes a VGAM3119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3119 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3119 precursor RNA is designated SEQ ID:70911, and is provided hereinbelow with reference to the sequence listing part.

[43627] VGAM3119 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43628] An enzyme complex designated DICER COMPLEX, dices the VGAM3119 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3119 RNA is designated SEQ ID:70912, and is provided hereinbelow with reference to the sequence listing part.

[43629] VGAM3119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3119 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3119 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43630] VGAM3119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3119 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3119 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43631] The complementary binding of VGAM3119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3119

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43632] It is appreciated that VGAM3119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3119 host target genes. The mRNA of each one of this plurality of VGAM3119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3119 RNA, herein designated VGAM RNA, and which when bound by VGAM3119 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3119 host target proteins.

[43633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3119 gene, herein designated VGAM GENE, on one or more VGAM3119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43634] It is yet further appreciated that a function of VGAM3119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3119 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM3119 correlate with, and may be deduced from, the identity of the host target genes which VGAM3119 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43635] Nucleotide sequences of the VGAM3119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3119 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3119 are further described hereinbelow with reference to Table 1.

[43636] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3119 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43637] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3120 (VGAM3120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43638] VGAM3120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3120 was detected is described hereinabove with reference to Figs. 2-8.

[43639] VGAM3120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 20. VGAM3120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[43640] VGAM3120 gene, herein designated VGAM GENE, encodes a VGAM3120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3120 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3120 precursor RNA is designated SEQ ID:70929, and is provided hereinbelow with reference to the sequence listing part.

[43641] VGAM3120 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43642] An enzyme complex designated DICER COMPLEX, dices the VGAM3120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3120 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3120 RNA is designated SEQ ID:70930, and is provided hereinbelow with reference to the sequence listing part.

[43643] VGAM3120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3120 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43644] VGAM3120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3120 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43645] The complementary binding of VGAM3120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3120 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43646] It is appreciated that VGAM3120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3120 host target genes. The mRNA of each one of this plurality of VGAM3120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3120 RNA, herein designated VGAM RNA, and which when bound by VGAM3120 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3120 host target proteins.

[43647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3120 gene, herein designated VGAM GENE, on one or more VGAM3120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43648] It is yet further appreciated that a function of VGAM3120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3120 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 20. Specific functions, and accordingly utilities, of VGAM3120 correlate with, and may be deduced from, the identity of the host target genes which VGAM3120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43649] Nucleotide sequences of the VGAM3120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3120 are further

described hereinbelow with reference to Table 1.

[43650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43651] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3121 (VGAM3121) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43652] VGAM3121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3121 was detected is described hereinabove with reference to Figs. 2-8.

[43653] VGAM3121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea early browning virus. VGAM3121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43654] VGAM3121 gene, herein designated VGAM GENE, encodes a VGAM3121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3121 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3121 precursor RNA is designated SEQ ID:70950, and is provided hereinbelow with reference to the sequence listing part.

[43655] VGAM3121 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43656] An enzyme complex designated DICER COMPLEX, dices the VGAM3121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3121 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3121 RNA is designated SEQ ID:70951, and is provided hereinbelow with reference to the sequence listing part.

[43657] VGAM3121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43658] VGAM3121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3121 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43659] The complementary binding of VGAM3121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3121 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3121 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43660] It is appreciated that VGAM3121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3121 host target genes. The mRNA of each one of this plurality of VGAM3121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3121 RNA, herein designated VGAM RNA, and which when bound by VGAM3121 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3121 host target proteins.

[43661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3121 gene, herein designated VGAM GENE, on one or more VGAM3121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43662] It is yet further appreciated that a function of VGAM3121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3121 include diagnosis, prevention and treatment of viral infection by Pea early browning virus. Specific functions, and accordingly utilities, of VGAM3121 correlate with, and may be deduced from, the identity of the host target genes which VGAM3121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43663] Nucleotide sequences of the VGAM3121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3121 are further described hereinbelow with reference to Table 1.

[43664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43665] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3122 (VGAM3122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43666] VGAM3122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3122 was detected is described hereinabove with reference to Figs. 2-8.

[43667] VGAM3122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat golden stripe virus. VGAM3122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43668] VGAM3122 gene, herein designated VGAM GENE, encodes

a VGAM3122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3122 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3122 precursor RNA is designated SEQ ID:70960, and is provided hereinbelow with reference to the sequence listing part.

[43669] VGAM3122 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43670] An enzyme complex designated DICER COMPLEX, dices the VGAM3122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3122 RNA is designated SEQ ID:70961, and is provided hereinbelow with reference to the sequence listing part.

[43671] VGAM3122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43672] VGAM3122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3122 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43673] The complementary binding of VGAM3122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3122 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[43674] It is appreciated that VGAM3122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3122 host target genes. The mRNA of each one of this plurality of VGAM3122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3122 RNA, herein designated VGAM RNA, and which when bound by VGAM3122 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3122 host target proteins.

[43675] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3122 gene, herein designated VGAM GENE, on one or more VGAM3122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43676] It is yet further appreciated that a function of VGAM3122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3122 include diagnosis, prevention and treatment of viral infection by Oat golden stripe virus. Specific functions, and accordingly utilities, of VGAM3122 correlate with, and may be deduced from, the identity of the host target genes which VGAM3122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43677] Nucleotide sequences of the VGAM3122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3122 are further described hereinbelow with reference to Table 1.

[43678] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43679] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3123 (VGAM3123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43680] VGAM3123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3123 was detected is described hereinabove with reference to Figs. 2-8.

[43681] VGAM3123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43682] VGAM3123 gene, herein designated VGAM GENE, encodes a VGAM3123 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3123 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3123 precursor RNA is designated SEQ ID:70977, and is provided hereinbelow with reference to the sequence listing part.

[43683] VGAM3123 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43684] An enzyme complex designated DICER COMPLEX, dices the VGAM3123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3123 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3123 RNA is designated SEQ ID:70978, and is provided hereinbelow with reference to the sequence listing part.

[43685] VGAM3123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43686] VGAM3123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3123 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43687] The complementary binding of VGAM3123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3123 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43688] It is appreciated that VGAM3123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3123 host target genes. The mRNA of each one of this plurality of VGAM3123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3123 RNA, herein designated VGAM RNA, and which when bound by VGAM3123 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3123 host target proteins.

[43689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3123 gene, herein designated VGAM GENE, on one or more VGAM3123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43690] It is yet further appreciated that a function of VGAM3123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3123 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3123 correlate with, and may be deduced from, the identity of the host target genes which VGAM3123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43691] Nucleotide sequences of the VGAM3123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3123 are further described hereinbelow with reference to Table 1.

[43692] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43693] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3124 (VGAM3124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43694] VGAM3124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3124 was detected is described hereinabove with reference to Figs. 2-8.

[43695] VGAM3124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43696] VGAM3124 gene, herein designated VGAM GENE, encodes a VGAM3124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3124 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3124 precursor RNA is designated SEQ ID:70985, and is provided hereinbelow with reference to the sequence listing part.

[43697] VGAM3124 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43698] An enzyme complex designated DICER COMPLEX, dices the VGAM3124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3124 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3124 RNA is designated SEQ ID:70986, and is provided hereinbelow with reference to the sequence listing part.

[43699] VGAM3124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43700] VGAM3124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3124 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43701] The complementary binding of VGAM3124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3124 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43702] It is appreciated that VGAM3124 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3124 host target genes. The mRNA of each one of this plurality of VGAM3124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3124 RNA, herein designated VGAM RNA, and which when bound by VGAM3124 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3124 host target proteins.

[43703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3124 gene, herein designated VGAM GENE, on one or more VGAM3124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43704] It is yet further appreciated that a function of VGAM3124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3124 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3124 correlate with, and may be deduced from, the identity of the host target genes which VGAM3124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43705] Nucleotide sequences of the VGAM3124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3124 are further described hereinbelow with reference to Table 1.

[43706] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43707] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3125 (VGAM3125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43708] VGAM3125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3125 was detected is described hereinabove with reference to Figs. 2–8.

[43709] VGAM3125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43710] VGAM3125 gene, herein designated VGAM GENE, encodes a VGAM3125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3125 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3125 precursor RNA is designated SEQ ID:70990, and is provided hereinbelow with reference to the sequence listing part.

[43711] VGAM3125 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43712] An enzyme complex designated DICER COMPLEX, dices the VGAM3125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3125 RNA is designated SEQ ID:70991, and is provided hereinbelow with reference to the sequence listing part.

[43713] VGAM3125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43714] VGAM3125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3125 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43715] The complementary binding of VGAM3125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3125 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43716] It is appreciated that VGAM3125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3125 host target genes. The mRNA of each one of this plurality of VGAM3125 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3125 RNA, herein designated VGAM RNA, and which when bound by VGAM3125 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3125 host target proteins.

[43717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3125 gene, herein designated VGAM GENE, on one or more VGAM3125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [43718] It is yet further appreciated that a function of VGAM3125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3125 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3125 correlate with, and may be deduced from, the identity of the host target genes which VGAM3125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [43719] Nucleotide sequences of the VGAM3125 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3125 are further described hereinbelow with reference to Table 1.
- [43720] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3125 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43721] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3126 (VGAM3126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43722] VGAM3126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3126 was detected is described hereinabove with reference to Figs. 2-8.

[43723] VGAM3126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43724] VGAM3126 gene, herein designated VGAM GENE, encodes a VGAM3126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3126 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3126 precursor RNA is designated SEQ ID:71023, and is provided hereinbelow with reference to the sequence listing part.

[43725] VGAM3126 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43726] An enzyme complex designated DICER COMPLEX, dices the VGAM3126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3126 RNA is designated SEQ ID:71024, and is provided hereinbelow with reference to the sequence listing part.

[43727] VGAM3126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43728] VGAM3126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3126 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43729] The complementary binding of VGAM3126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3126 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43730] It is appreciated that VGAM3126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3126 host target genes. The mRNA of

each one of this plurality of VGAM3126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3126 RNA, herein designated VGAM RNA, and which when bound by VGAM3126 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3126 host target proteins.

[43731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3126 gene, herein designated VGAM GENE, on one or more VGAM3126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[43732] It is yet further appreciated that a function of VGAM3126 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3126 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3126 correlate with, and may be deduced from, the identity of the host target genes which VGAM3126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43733] Nucleotide sequences of the VGAM3126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3126 are further described hereinbelow with reference to Table 1.

[43734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3126 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[43735] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3127 (VGAM3127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43736] VGAM3127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3127 was detected is described hereinabove with reference to Figs. 2–8.

[43737] VGAM3127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 32. VGAM3127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43738] VGAM3127 gene, herein designated VGAM GENE, encodes a VGAM3127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3127 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3127 precursor RNA is designated SEQ ID:71045, and is provided hereinbelow with reference to the sequence listing part.

[43739] VGAM3127 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43740] An enzyme complex designated DICER COMPLEX, dices the VGAM3127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3127 RNA is designated SEQ ID:71046,

and is provided hereinbelow with reference to the sequence listing part.

[43741] VGAM3127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43742] VGAM3127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3127 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43743] The complementary binding of VGAM3127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3127 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43744] It is appreciated that VGAM3127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3127 host target genes. The mRNA of each one of this plurality of VGAM3127 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3127 RNA, herein designated VGAM RNA, and which when bound by VGAM3127 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3127 host target proteins.

[43745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3127 gene, herein designated VGAM GENE, on one or more VGAM3127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43746] It is yet further appreciated that a function of VGAM3127 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3127 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 32. Specific functions, and accordingly utilities, of VGAM3127 correlate with, and may be deduced from, the identity of the host target genes which VGAM3127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43747] Nucleotide sequences of the VGAM3127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3127 are further described hereinbelow with reference to Table 1.

[43748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43749] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3128 (VGAM3128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43750] VGAM3128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3128 was detected is described hereinabove with reference to Figs. 2–8.

[43751] VGAM3128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 38. VGAM3128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43752] VGAM3128 gene, herein designated VGAM GENE, encodes a VGAM3128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3128 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3128 precu-

sor RNA is designated SEQ ID:71087, and is provided hereinbelow with reference to the sequence listing part.

[43753] VGAM3128 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43754] An enzyme complex designated DICER COMPLEX, dices the VGAM3128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3128 RNA is designated SEQ ID:71088, and is provided hereinbelow with reference to the se-

quence listing part.

[43755] VGAM3128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43756] VGAM3128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3128 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43757] The complementary binding of VGAM3128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3128 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43758] It is appreciated that VGAM3128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3128 host target genes. The mRNA of each one of this plurality of VGAM3128 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3128 RNA, herein designated VGAM RNA, and which when bound by VGAM3128 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3128 host target proteins.

[43759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3128 gene, herein designated VGAM GENE, on one or more VGAM3128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43760] It is yet further appreciated that a function of VGAM3128

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3128 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 38. Specific functions, and accordingly utilities, of VGAM3128 correlate with, and may be deduced from, the identity of the host target genes which VGAM3128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43761] Nucleotide sequences of the VGAM3128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3128 are further described hereinbelow with reference to Table 1.

[43762] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43763] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3129 (VGAM3129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43764] VGAM3129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3129 was detected is described hereinabove with reference to Figs. 2–8.

[43765] VGAM3129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43766] VGAM3129 gene, herein designated VGAM GENE, encodes a VGAM3129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3129 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3129 precursor RNA is designated SEQ ID:71095, and is provided

hereinbelow with reference to the sequence listing part.

[43767] VGAM3129 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43768] An enzyme complex designated DICER COMPLEX, dices the VGAM3129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3129 RNA is designated SEQ ID:71096, and is provided hereinbelow with reference to the sequence listing part.

[43769] VGAM3129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43770] VGAM3129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3129 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3129 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43771] The complementary binding of VGAM3129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3129 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43772] It is appreciated that VGAM3129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3129 host target genes. The mRNA of each one of this plurality of VGAM3129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3129 RNA, herein designated VGAM RNA, and which when bound by VGAM3129 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3129 host target proteins.

[43773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3129 gene, herein designated VGAM GENE, on one or more VGAM3129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43774] It is yet further appreciated that a function of VGAM3129 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3129 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3129 correlate with, and may be deduced from, the identity of the host target genes which VGAM3129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43775] Nucleotide sequences of the VGAM3129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3129 are further described hereinbelow with reference to Table 1.

[43776] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3129 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43777] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3130 (VGAM3130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43778] VGAM3130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3130 was detected is described hereinabove with reference to Figs. 2–8.

[43779] VGAM3130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43780] VGAM3130 gene, herein designated VGAM GENE, encodes a VGAM3130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3130 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3130 precursor RNA is designated SEQ ID:71107, and is provided hereinbelow with reference to the sequence listing part.

[43781] VGAM3130 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43782] An enzyme complex designated DICER COMPLEX, dices the VGAM3130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3130 RNA is designated SEQ ID:71108, and is provided hereinbelow with reference to the sequence listing part.

[43783] VGAM3130 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43784] VGAM3130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3130 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3130 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43785] The complementary binding of VGAM3130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3130 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43786] It is appreciated that VGAM3130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3130 host target genes. The mRNA of each one of this plurality of VGAM3130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3130 RNA, herein designated VGAM

RNA, and which when bound by VGAM3130 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3130 host target proteins.

[43787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3130 gene, herein designated VGAM GENE, on one or more VGAM3130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43788] It is yet further appreciated that a function of VGAM3130 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3130 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3130 correlate with, and may be deduced from, the identity of the host target genes which VGAM3130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43789] Nucleotide sequences of the VGAM3130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3130 are further described hereinbelow with reference to Table 1.

[43790] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43791] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3131 (VGAM3131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43792] VGAM3131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3131 was detected is described hereinabove with reference to Figs. 2-8.

[43793] VGAM3131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43794] VGAM3131 gene, herein designated VGAM GENE, encodes a VGAM3131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3131 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3131 precursor RNA is designated SEQ ID:71115, and is provided hereinbelow with reference to the sequence listing part.

[43795] VGAM3131 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43796] An enzyme complex designated DICER COMPLEX, dices the VGAM3131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3131 RNA is designated SEQ ID:71116, and is provided hereinbelow with reference to the sequence listing part.

[43797] VGAM3131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3131 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43798] VGAM3131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3131 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3131 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43799] The complementary binding of VGAM3131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3131 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43800] It is appreciated that VGAM3131 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3131 host target genes. The mRNA of each one of this plurality of VGAM3131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3131 RNA, herein designated VGAM RNA, and which when bound by VGAM3131 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3131 host target proteins.

[43801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3131 gene, herein designated VGAM GENE, on one or more VGAM3131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43802] It is yet further appreciated that a function of VGAM3131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3131 include diagnosis, prevention and

treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3131 correlate with, and may be deduced from, the identity of the host target genes which VGAM3131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43803] Nucleotide sequences of the VGAM3131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3131 are further described hereinbelow with reference to Table 1.

[43804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43805] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3132 (VGAM3132) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43806] VGAM3132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3132 was detected is described hereinabove with reference to Figs. 2–8.

[43807] VGAM3132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43808] VGAM3132 gene, herein designated VGAM GENE, encodes a VGAM3132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3132 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3132 precursor RNA is designated SEQ ID:71122, and is provided hereinbelow with reference to the sequence listing part.

[43809] VGAM3132 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3132 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43810] An enzyme complex designated DICER COMPLEX, dices the VGAM3132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3132 RNA is designated SEQ ID:71123, and is provided hereinbelow with reference to the sequence listing part.

[43811] VGAM3132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3132 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3132 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43812] VGAM3132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3132 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3132 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43813] The complementary binding of VGAM3132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3132 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43814] It is appreciated that VGAM3132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3132 host target genes. The mRNA of each one of this plurality of VGAM3132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3132 RNA, herein designated VGAM RNA, and which when bound by VGAM3132 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3132 host target proteins.

[43815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3132 gene, herein designated VGAM GENE, on one or more VGAM3132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43816] It is yet further appreciated that a function of VGAM3132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3132 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Spe-

cific functions, and accordingly utilities, of VGAM3132 correlate with, and may be deduced from, the identity of the host target genes which VGAM3132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43817] Nucleotide sequences of the VGAM3132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3132 are further described hereinbelow with reference to Table 1.

[43818] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43819] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3133 (VGAM3133) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[43820] VGAM3133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3133 was detected is described hereinabove with reference to Figs. 2–8.

[43821] VGAM3133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43822] VGAM3133 gene, herein designated VGAM GENE, encodes a VGAM3133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3133 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3133 precursor RNA is designated SEQ ID:71130, and is provided hereinbelow with reference to the sequence listing part.

[43823] VGAM3133 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3133 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43824] An enzyme complex designated DICER COMPLEX, dices the VGAM3133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3133 RNA is designated SEQ ID:71131, and is provided hereinbelow with reference to the sequence listing part.

[43825] VGAM3133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3133 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43826] VGAM3133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3133 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43827] The complementary binding of VGAM3133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3133 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43828] It is appreciated that VGAM3133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3133 host target genes. The mRNA of each one of this plurality of VGAM3133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3133 RNA, herein designated VGAM RNA, and which when bound by VGAM3133 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3133 host target proteins.

[43829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3133 gene, herein designated VGAM GENE, on one or more VGAM3133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43830] It is yet further appreciated that a function of VGAM3133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3133 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities,

of VGAM3133 correlate with, and may be deduced from, the identity of the host target genes which VGAM3133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43831] Nucleotide sequences of the VGAM3133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3133 are further described hereinbelow with reference to Table 1.

[43832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43833] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3134 (VGAM3134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[43834] VGAM3134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3134 was detected is described hereinabove with reference to Figs. 2-8.

[43835] VGAM3134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43836] VGAM3134 gene, herein designated VGAM GENE, encodes a VGAM3134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3134 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3134 precursor RNA is designated SEQ ID:71137, and is provided hereinbelow with reference to the sequence listing part.

[43837] VGAM3134 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43838] An enzyme complex designated DICER COMPLEX, dices the VGAM3134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3134 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3134 RNA is designated SEQ ID:71138, and is provided hereinbelow with reference to the sequence listing part.

[43839] VGAM3134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43840] VGAM3134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3134 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43841] The complementary binding of VGAM3134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3134 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3134 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43842] It is appreciated that VGAM3134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3134 host target genes. The mRNA of each one of this plurality of VGAM3134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3134 RNA, herein designated VGAM RNA, and which when bound by VGAM3134 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3134 host target proteins.

[43843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3134 gene, herein designated VGAM GENE, on one or more VGAM3134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43844] It is yet further appreciated that a function of VGAM3134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3134 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3134 correlate with, and may be deduced from, the identity of the host target genes which VGAM3134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43845] Nucleotide sequences of the VGAM3134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3134 are further described hereinbelow with reference to Table 1.

[43846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43847] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3135 (VGAM3135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43848] VGAM3135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3135 was detected is described hereinabove with reference to Figs. 2-8.

[43849] VGAM3135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43850] VGAM3135 gene, herein designated VGAM GENE, encodes

a VGAM3135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3135 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3135 precursor RNA is designated SEQ ID:71142, and is provided hereinbelow with reference to the sequence listing part.

[43851] VGAM3135 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43852] An enzyme complex designated DICER COMPLEX, dices the VGAM3135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3135 RNA is designated SEQ ID:71143, and is provided hereinbelow with reference to the sequence listing part.

[43853] VGAM3135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43854] VGAM3135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3135 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43855] The complementary binding of VGAM3135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3135 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[43856] It is appreciated that VGAM3135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3135 host target genes. The mRNA of each one of this plurality of VGAM3135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3135 RNA, herein designated VGAM RNA, and which when bound by VGAM3135 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3135 host target proteins.

[43857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3135 gene, herein designated VGAM GENE, on one or more VGAM3135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43858] It is yet further appreciated that a function of VGAM3135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3135 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3135 correlate with, and may be deduced from, the identity of the host target genes which VGAM3135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43859] Nucleotide sequences of the VGAM3135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3135 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3135 are further described hereinbelow with reference to Table 1.

[43860] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43861] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3136 (VGAM3136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43862] VGAM3136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3136 was detected is described hereinabove with reference to Figs. 2-8.

[43863] VGAM3136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43864] VGAM3136 gene, herein designated VGAM GENE, encodes a VGAM3136 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3136 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3136 precursor RNA is designated SEQ ID:71188, and is provided hereinbelow with reference to the sequence listing part.

[43865] VGAM3136 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43866] An enzyme complex designated DICER COMPLEX, dices the VGAM3136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3136 RNA is designated SEQ ID:71189, and is provided hereinbelow with reference to the sequence listing part.

[43867] VGAM3136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43868] VGAM3136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3136 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43869] The complementary binding of VGAM3136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3136 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43870] It is appreciated that VGAM3136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3136 host target genes. The mRNA of each one of this plurality of VGAM3136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3136 RNA, herein designated VGAM RNA, and which when bound by VGAM3136 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3136 host target proteins.

[43871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3136 gene, herein designated VGAM GENE, on one or more VGAM3136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43872] It is yet further appreciated that a function of VGAM3136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3136 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3136 correlate with, and may be deduced from, the identity of the host target genes which VGAM3136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43873] Nucleotide sequences of the VGAM3136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3136 are further described hereinbelow with reference to Table 1.

[43874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43875] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3137 (VGAM3137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43876] VGAM3137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3137 was detected is described hereinabove with reference to Figs. 2-8.

[43877] VGAM3137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Caprine arthritis-encephalitis virus. VGAM3137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43878] VGAM3137 gene, herein designated VGAM GENE, encodes a VGAM3137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3137 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3137 precursor RNA is designated SEQ ID:71198, and is provided hereinbelow with reference to the sequence listing part.

[43879] VGAM3137 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43880] An enzyme complex designated DICER COMPLEX, dices the VGAM3137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3137 RNA is designated SEQ ID:71199, and is provided hereinbelow with reference to the sequence listing part.

[43881] VGAM3137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43882] VGAM3137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3137 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43883] The complementary binding of VGAM3137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3137 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43884] It is appreciated that VGAM3137 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3137 host target genes. The mRNA of each one of this plurality of VGAM3137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3137 RNA, herein designated VGAM RNA, and which when bound by VGAM3137 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3137 host target proteins.

[43885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3137 gene, herein designated VGAM GENE, on one or more VGAM3137 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43886] It is yet further appreciated that a function of VGAM3137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3137 include diagnosis, prevention and treatment of viral infection by Caprine arthritis–encephalitis virus. Specific functions, and accordingly utilities, of VGAM3137 correlate with, and may be deduced from, the identity of the host target genes which VGAM3137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43887] Nucleotide sequences of the VGAM3137 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3137 are further described hereinbelow with reference to Table 1.

[43888] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43889] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3138 (VGAM3138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43890] VGAM3138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3138 was detected is described hereinabove with reference to Figs. 2–8.

[43891] VGAM3138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine arteritis virus. VGAM3138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43892] VGAM3138 gene, herein designated VGAM GENE, encodes a VGAM3138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3138 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3138 precursor RNA is designated SEQ ID:71216, and is provided hereinbelow with reference to the sequence listing part.

[43893] VGAM3138 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43894] An enzyme complex designated DICER COMPLEX, dices the VGAM3138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3138 RNA is designated SEQ ID:71217, and is provided hereinbelow with reference to the sequence listing part.

[43895] VGAM3138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43896] VGAM3138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3138 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43897] The complementary binding of VGAM3138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3138 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43898] It is appreciated that VGAM3138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3138 host target genes. The mRNA of each one of this plurality of VGAM3138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3138 RNA, herein designated VGAM RNA, and which when bound by VGAM3138 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3138 host target proteins.

[43899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3138 gene, herein designated VGAM GENE, on one or more VGAM3138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [43900] It is yet further appreciated that a function of VGAM3138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3138 include diagnosis, prevention and treatment of viral infection by Equine arteritis virus. Specific functions, and accordingly utilities, of VGAM3138 correlate with, and may be deduced from, the identity of the host target genes which VGAM3138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [43901] Nucleotide sequences of the VGAM3138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3138 are further described hereinbelow with reference to Table 1.
- [43902] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43903] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3139 (VGAM3139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43904] VGAM3139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3139 was detected is described hereinabove with reference to Figs. 2-8.

[43905] VGAM3139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine immunodeficiency virus. VGAM3139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43906] VGAM3139 gene, herein designated VGAM GENE, encodes a VGAM3139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3139 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3139 precursor RNA is designated SEQ ID:71230, and is provided hereinbelow with reference to the sequence listing part.

[43907] VGAM3139 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43908] An enzyme complex designated DICER COMPLEX, dices the VGAM3139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3139 RNA is designated SEQ ID:71231, and is provided hereinbelow with reference to the sequence listing part.

[43909] VGAM3139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43910] VGAM3139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3139 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43911] The complementary binding of VGAM3139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3139 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43912] It is appreciated that VGAM3139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3139 host target genes. The mRNA of

each one of this plurality of VGAM3139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3139 RNA, herein designated VGAM RNA, and which when bound by VGAM3139 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3139 host target proteins.

[43913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3139 gene, herein designated VGAM GENE, on one or more VGAM3139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[43914] It is yet further appreciated that a function of VGAM3139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3139 include diagnosis, prevention and treatment of viral infection by Bovine immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM3139 correlate with, and may be deduced from, the identity of the host target genes which VGAM3139 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43915] Nucleotide sequences of the VGAM3139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3139 are further described hereinbelow with reference to Table 1.

[43916] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3139 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[43917] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3140 (VGAM3140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43918] VGAM3140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3140 was detected is described hereinabove with reference to Figs. 2–8.

[43919] VGAM3140 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM3140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43920] VGAM3140 gene, herein designated VGAM GENE, encodes a VGAM3140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3140 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3140 precursor RNA is designated SEQ ID:71237, and is provided hereinbelow with reference to the sequence listing part.

[43921] VGAM3140 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43922] An enzyme complex designated DICER COMPLEX, dices the VGAM3140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3140 RNA is designated SEQ ID:31651,

and is provided hereinbelow with reference to the sequence listing part.

[43923] VGAM3140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43924] VGAM3140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3140 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43925] The complementary binding of VGAM3140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3140 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43926] It is appreciated that VGAM3140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3140 host target genes. The mRNA of each one of this plurality of VGAM3140 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3140 RNA, herein designated VGAM RNA, and which when bound by VGAM3140 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3140 host target proteins.

[43927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3140 gene, herein designated VGAM GENE, on one or more VGAM3140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43928] It is yet further appreciated that a function of VGAM3140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3140 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3140 correlate with, and may be deduced from, the identity of the host target genes which VGAM3140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43929] Nucleotide sequences of the VGAM3140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3140 are further described hereinbelow with reference to Table 1.

[43930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43931] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3141 (VGAM3141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43932] VGAM3141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3141 was detected is described hereinabove with reference to Figs. 2–8.

[43933] VGAM3141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM3141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43934] VGAM3141 gene, herein designated VGAM GENE, encodes a VGAM3141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3141 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3141 precu-

sor RNA is designated SEQ ID:71238, and is provided hereinbelow with reference to the sequence listing part.

[43935] VGAM3141 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43936] An enzyme complex designated DICER COMPLEX, dices the VGAM3141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3141 RNA is designated SEQ ID:71239, and is provided hereinbelow with reference to the se-

quence listing part.

[43937] VGAM3141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43938] VGAM3141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3141 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43939] The complementary binding of VGAM3141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3141 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43940] It is appreciated that VGAM3141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3141 host target genes. The mRNA of each one of this plurality of VGAM3141 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3141 RNA, herein designated VGAM RNA, and which when bound by VGAM3141 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3141 host target proteins.

[43941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3141 gene, herein designated VGAM GENE, on one or more VGAM3141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43942] It is yet further appreciated that a function of VGAM3141

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3141 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM3141 correlate with, and may be deduced from, the identity of the host target genes which VGAM3141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43943] Nucleotide sequences of the VGAM3141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3141 are further described hereinbelow with reference to Table 1.

[43944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43945] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3142 (VGAM3142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43946] VGAM3142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3142 was detected is described hereinabove with reference to Figs. 2–8.

[43947] VGAM3142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM3142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43948] VGAM3142 gene, herein designated VGAM GENE, encodes a VGAM3142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3142 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3142 precursor RNA is designated SEQ ID:71249, and is provided

hereinbelow with reference to the sequence listing part.

[43949] VGAM3142 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43950] An enzyme complex designated DICER COMPLEX, dices the VGAM3142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3142 RNA is designated SEQ ID:71250, and is provided hereinbelow with reference to the sequence listing part.

[43951] VGAM3142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43952] VGAM3142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3142 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3142 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43953] The complementary binding of VGAM3142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3142 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43954] It is appreciated that VGAM3142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3142 host target genes. The mRNA of each one of this plurality of VGAM3142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3142 RNA, herein designated VGAM RNA, and which when bound by VGAM3142 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3142 host target proteins.

[43955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3142 gene, herein designated VGAM GENE, on one or more VGAM3142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43956] It is yet further appreciated that a function of VGAM3142 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3142 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM3142 correlate with, and may be deduced from, the identity of the host target genes which VGAM3142 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43957] Nucleotide sequences of the VGAM3142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3142 are further described hereinbelow with reference to Table 1.

[43958] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43959] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3143 (VGAM3143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43960] VGAM3143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3143 was detected is described hereinabove with reference to Figs. 2–8.

[43961] VGAM3143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43962] VGAM3143 gene, herein designated VGAM GENE, encodes a VGAM3143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3143 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3143 precursor RNA is designated SEQ ID:71263, and is provided hereinbelow with reference to the sequence listing part.

[43963] VGAM3143 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43964] An enzyme complex designated DICER COMPLEX, dices the VGAM3143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3143 RNA is designated SEQ ID:71264, and is provided hereinbelow with reference to the sequence listing part.

[43965] VGAM3143 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43966] VGAM3143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3143 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3143 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43967] The complementary binding of VGAM3143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3143 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43968] It is appreciated that VGAM3143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3143 host target genes. The mRNA of each one of this plurality of VGAM3143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3143 RNA, herein designated VGAM

RNA, and which when bound by VGAM3143 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3143 host target proteins.

[43969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3143 gene, herein designated VGAM GENE, on one or more VGAM3143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43970] It is yet further appreciated that a function of VGAM3143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3143 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3143 correlate with, and may be deduced from, the identity of the host target genes which VGAM3143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43971] Nucleotide sequences of the VGAM3143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3143 are further described hereinbelow with reference to Table 1.

[43972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43973] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3144 (VGAM3144) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43974] VGAM3144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3144 was detected is described hereinabove with reference to Figs. 2-8.

[43975] VGAM3144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43976] VGAM3144 gene, herein designated VGAM GENE, encodes a VGAM3144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3144 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3144 precursor RNA is designated SEQ ID:71286, and is provided hereinbelow with reference to the sequence listing part.

[43977] VGAM3144 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43978] An enzyme complex designated DICER COMPLEX, dices the VGAM3144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3144 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3144 RNA is designated SEQ ID:71287, and is provided hereinbelow with reference to the sequence listing part.

[43979] VGAM3144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3144 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43980] VGAM3144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3144 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3144 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43981] The complementary binding of VGAM3144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3144 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43982] It is appreciated that VGAM3144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3144 host target genes. The mRNA of each one of this plurality of VGAM3144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3144 RNA, herein designated VGAM RNA, and which when bound by VGAM3144 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3144 host target proteins.

[43983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3144 gene, herein designated VGAM GENE, on one or more VGAM3144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43984] It is yet further appreciated that a function of VGAM3144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3144 include diagnosis, prevention and

treatment of viral infection by *Paramecium bursaria*

Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3144 correlate with, and may be deduced from, the identity of the host target genes which VGAM3144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43985] Nucleotide sequences of the VGAM3144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3144 are further described hereinbelow with reference to Table 1.

[43986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43987] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3145 (VGAM3145) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43988] VGAM3145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3145 was detected is described hereinabove with reference to Figs. 2–8.

[43989] VGAM3145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43990] VGAM3145 gene, herein designated VGAM GENE, encodes a VGAM3145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3145 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3145 precursor RNA is designated SEQ ID:71292, and is provided hereinbelow with reference to the sequence listing part.

[43991] VGAM3145 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3145 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43992] An enzyme complex designated DICER COMPLEX, dices the VGAM3145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3145 RNA is designated SEQ ID:71293, and is provided hereinbelow with reference to the sequence listing part.

[43993] VGAM3145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3145 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3145 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[43994] VGAM3145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3145 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3145 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[43995] The complementary binding of VGAM3145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3145 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43996] It is appreciated that VGAM3145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3145 host target genes. The mRNA of each one of this plurality of VGAM3145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3145 RNA, herein designated VGAM RNA, and which when bound by VGAM3145 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3145 host target proteins.

[43997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3145 gene, herein designated VGAM GENE, on one or more VGAM3145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[43998] It is yet further appreciated that a function of VGAM3145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3145 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM3145 correlate with, and may be deduced from, the identity of the host target genes which VGAM3145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43999] Nucleotide sequences of the VGAM3145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3145 are further described hereinbelow with reference to Table 1.

[44000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3145 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44001] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3146 (VGAM3146) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[44002] VGAM3146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3146 was detected is described hereinabove with reference to Figs. 2–8.

[44003] VGAM3146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 22. VGAM3146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44004] VGAM3146 gene, herein designated VGAM GENE, encodes a VGAM3146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3146 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3146 precursor RNA is designated SEQ ID:71425, and is provided hereinbelow with reference to the sequence listing part.

[44005] VGAM3146 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3146 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44006] An enzyme complex designated DICER COMPLEX, dices the VGAM3146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3146 RNA is designated SEQ ID:71426, and is provided hereinbelow with reference to the sequence listing part.

[44007] VGAM3146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3146 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44008] VGAM3146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3146 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44009] The complementary binding of VGAM3146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3146 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44010] It is appreciated that VGAM3146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3146 host target genes. The mRNA of each one of this plurality of VGAM3146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3146 RNA, herein designated VGAM RNA, and which when bound by VGAM3146 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3146 host target proteins.

[44011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3146 gene, herein designated VGAM GENE, on one or more VGAM3146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44012] It is yet further appreciated that a function of VGAM3146 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3146 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 22. Specific functions, and accordingly utilities, of

VGAM3146 correlate with, and may be deduced from, the identity of the host target genes which VGAM3146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44013] Nucleotide sequences of the VGAM3146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3146 are further described hereinbelow with reference to Table 1.

[44014] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44015] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3147 (VGAM3147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[44016] VGAM3147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3147 was detected is described hereinabove with reference to Figs. 2–8.

[44017] VGAM3147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44018] VGAM3147 gene, herein designated VGAM GENE, encodes a VGAM3147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3147 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3147 precursor RNA is designated SEQ ID:71432, and is provided hereinbelow with reference to the sequence listing part.

[44019] VGAM3147 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44020] An enzyme complex designated DICER COMPLEX, dices the VGAM3147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3147 RNA is designated SEQ ID:71433, and is provided hereinbelow with reference to the sequence listing part.

[44021] VGAM3147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44022] VGAM3147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3147 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44023] The complementary binding of VGAM3147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3147 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44024] It is appreciated that VGAM3147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3147 host target genes. The mRNA of each one of this plurality of VGAM3147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3147 RNA, herein designated VGAM RNA, and which when bound by VGAM3147 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3147 host target proteins.

[44025] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3147 gene, herein designated VGAM GENE, on one or more VGAM3147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44026] It is yet further appreciated that a function of VGAM3147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3147 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3147 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44027] Nucleotide sequences of the VGAM3147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3147 are further described hereinbelow with reference to Table 1.

[44028] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44029] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3148 (VGAM3148) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44030] VGAM3148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3148 was detected is described hereinabove with reference to Figs. 2–8.

[44031] VGAM3148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44032] VGAM3148 gene, herein designated VGAM GENE, encodes a VGAM3148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3148 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3148 precursor RNA is designated SEQ ID:71489, and is provided hereinbelow with reference to the sequence listing part.

[44033] VGAM3148 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44034] An enzyme complex designated DICER COMPLEX, dices the VGAM3148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3148 RNA is designated SEQ ID:71490, and is provided hereinbelow with reference to the sequence listing part.

[44035] VGAM3148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44036] VGAM3148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3148 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44037] The complementary binding of VGAM3148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3148 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44038] It is appreciated that VGAM3148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3148 host target genes. The mRNA of each one of this plurality of VGAM3148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3148 RNA, herein designated VGAM RNA, and which when bound by VGAM3148 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3148 host target proteins.

[44039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3148 gene, herein designated VGAM GENE, on one or more VGAM3148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44040] It is yet further appreciated that a function of VGAM3148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3148 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3148 correlate with, and may be deduced from, the identity of the host target genes which VGAM3148 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[44041] Nucleotide sequences of the VGAM3148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3148 are further described hereinbelow with reference to Table 1.

[44042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44043] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3149 (VGAM3149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44044] VGAM3149 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3149 was detected is described hereinabove with reference to Figs. 2–8.

[44045] VGAM3149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 24. VGAM3149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44046] VGAM3149 gene, herein designated VGAM GENE, encodes a VGAM3149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3149 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3149 precursor RNA is designated SEQ ID:71507, and is provided hereinbelow with reference to the sequence listing part.

[44047] VGAM3149 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44048] An enzyme complex designated DICER COMPLEX, dices the VGAM3149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3149 RNA is designated SEQ ID:71508, and is provided hereinbelow with reference to the sequence listing part.

[44049] VGAM3149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44050] VGAM3149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3149 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[44051] The complementary binding of VGAM3149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3149 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44052] It is appreciated that VGAM3149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3149 host target genes. The mRNA of each one of this plurality of VGAM3149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3149 RNA, herein designated VGAM RNA, and which when bound by VGAM3149 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3149 host target proteins.

[44053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3149 gene, herein designated VGAM GENE, on one or more VGAM3149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44054] It is yet further appreciated that a function of VGAM3149 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3149 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 24. Specific functions, and accordingly utilities, of VGAM3149 correlate with, and may be deduced from, the identity of the host target genes which VGAM3149 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[44055] Nucleotide sequences of the VGAM3149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3149 are further described hereinbelow with reference to Table 1.

[44056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44057] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3150 (VGAM3150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44058] VGAM3150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3150 was detected is described hereinabove with reference to Figs. 2–8.

[44059] VGAM3150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 37. VGAM3150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44060] VGAM3150 gene, herein designated VGAM GENE, encodes a VGAM3150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3150 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3150 precursor RNA is designated SEQ ID:71539, and is provided hereinbelow with reference to the sequence listing part.

[44061] VGAM3150 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44062] An enzyme complex designated DICER COMPLEX, dices the VGAM3150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3150 RNA is designated SEQ ID:71540, and is provided hereinbelow with reference to the sequence listing part.

[44063] VGAM3150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[44064] VGAM3150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3150 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44065] The complementary binding of VGAM3150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3150 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44066] It is appreciated that VGAM3150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3150 host target genes. The mRNA of each one of this plurality of VGAM3150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3150 RNA, herein designated VGAM RNA, and which when bound by VGAM3150 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3150 host target proteins.

[44067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3150 gene, herein designated VGAM GENE, on one

or more VGAM3150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44068] It is yet further appreciated that a function of VGAM3150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3150 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 37. Specific functions, and accordingly utilities, of VGAM3150 correlate with, and may be deduced from, the identity of the host target genes which VGAM3150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44069] Nucleotide sequences of the VGAM3150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3150 are further described hereinbelow with reference to Table 1.

[44070] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44071] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3151 (VGAM3151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44072] VGAM3151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3151 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[44073] VGAM3151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM3151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44074] VGAM3151 gene, herein designated VGAM GENE, encodes a VGAM3151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3151 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3151 precursor RNA is designated SEQ ID:71549, and is provided hereinbelow with reference to the sequence listing part.

[44075] VGAM3151 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44076] An enzyme complex designated DICER COMPLEX, dices the VGAM3151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3151 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3151 RNA is designated SEQ ID:71550, and is provided hereinbelow with reference to the sequence listing part.

[44077] VGAM3151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44078] VGAM3151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3151 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3151 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44079] The complementary binding of VGAM3151 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3151 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44080] It is appreciated that VGAM3151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3151 host target genes. The mRNA of each one of this plurality of VGAM3151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3151 RNA, herein designated VGAM RNA, and which when bound by VGAM3151 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3151 host target proteins.

[44081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3151 gene, herein designated VGAM GENE, on one or more VGAM3151 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44082] It is yet further appreciated that a function of VGAM3151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3151 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3151 correlate with, and may be deduced from, the identity of the host target genes which VGAM3151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44083] Nucleotide sequences of the VGAM3151 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3151 are further described hereinbelow with reference to Table 1.

[44084] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44085] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3152 (VGAM3152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44086] VGAM3152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3152 was detected is described hereinabove with reference to Figs. 2-8.

[44087] VGAM3152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44088] VGAM3152 gene, herein designated VGAM GENE, encodes a VGAM3152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3152 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3152 precursor RNA is designated SEQ ID:71552, and is provided hereinbelow with reference to the sequence listing part.

[44089] VGAM3152 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[44090] An enzyme complex designated DICER COMPLEX, dices the VGAM3152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3152 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3152 RNA is designated SEQ ID:71553, and is provided hereinbelow with reference to the sequence listing part.

[44091] VGAM3152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44092] VGAM3152 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3152 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44093] The complementary binding of VGAM3152 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3152 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44094] It is appreciated that VGAM3152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3152 host target genes. The mRNA of each one of this plurality of VGAM3152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3152 RNA, herein designated VGAM RNA, and which when bound by VGAM3152 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3152 host target proteins.

[44095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3152 gene, herein designated VGAM GENE, on one or more VGAM3152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44096] It is yet further appreciated that a function of VGAM3152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3152 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3152 correlate with, and may be deduced from, the identity of the host target genes which VGAM3152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44097] Nucleotide sequences of the VGAM3152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3152 are further described hereinbelow with reference to Table 1.

[44098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44099] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3153 (VGAM3153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44100] VGAM3153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3153 was detected is described hereinabove with reference to Figs. 2-8.

[44101] VGAM3153 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Gallid herpesvirus 2. VGAM3153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44102] VGAM3153 gene, herein designated VGAM GENE, encodes a VGAM3153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3153 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3153 precursor RNA is designated SEQ ID:71566, and is provided hereinbelow with reference to the sequence listing part.

[44103] VGAM3153 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44104] An enzyme complex designated DICER COMPLEX, dices the VGAM3153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3153 RNA is designated SEQ ID:71567, and is provided hereinbelow with reference to the sequence listing part.

[44105] VGAM3153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3153 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44106] VGAM3153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3153 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44107] The complementary binding of VGAM3153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3153 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3153 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44108] It is appreciated that VGAM3153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3153 host target genes. The mRNA of each one of this plurality of VGAM3153 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3153 RNA, herein designated VGAM RNA, and which when bound by VGAM3153 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3153 host target proteins.

[44109] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3153 gene, herein designated VGAM GENE, on one or more VGAM3153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44110] It is yet further appreciated that a function of VGAM3153 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3153 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3153 correlate with, and may be deduced from, the identity of the host target genes which VGAM3153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44111] Nucleotide sequences of the VGAM3153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3153 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3153 are further described hereinbelow with reference to Table 1.

[44112] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44113] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3154 (VGAM3154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44114] VGAM3154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3154 was detected is described hereinabove with reference to Figs. 2-8.

[44115] VGAM3154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2.

VGAM3154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44116] VGAM3154 gene, herein designated VGAM GENE, encodes a VGAM3154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3154 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3154 precursor RNA is designated SEQ ID:71576, and is provided hereinbelow with reference to the sequence listing part.

[44117] VGAM3154 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44118] An enzyme complex designated DICER COMPLEX, dices

the VGAM3154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3154 RNA is designated SEQ ID:71577, and is provided hereinbelow with reference to the sequence listing part.

[44119] VGAM3154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3154 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44120] VGAM3154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3154 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3154 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44121] The complementary binding of VGAM3154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3154 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44122] It is appreciated that VGAM3154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3154 host target genes. The mRNA of each one of this plurality of VGAM3154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3154 RNA, herein designated VGAM RNA, and which when bound by VGAM3154 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3154 host target proteins.

[44123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3154 gene, herein designated VGAM GENE, on one or more VGAM3154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44124] It is yet further appreciated that a function of VGAM3154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3154 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3154 correlate with, and may be deduced from, the identity of the host target genes which VGAM3154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44125] Nucleotide sequences of the VGAM3154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3154 are further described hereinbelow with reference to Table 1.

[44126] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44127] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3155 (VGAM3155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44128] VGAM3155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3155 was detected is described hereinabove with reference to Figs. 2-8.

[44129] VGAM3155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3155 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44130] VGAM3155 gene, herein designated VGAM GENE, encodes a VGAM3155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3155 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3155 precursor RNA is designated SEQ ID:71586, and is provided hereinbelow with reference to the sequence listing part.

[44131] VGAM3155 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44132] An enzyme complex designated DICER COMPLEX, dices the VGAM3155 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3155 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3155 RNA is designated SEQ ID:71587, and is provided hereinbelow with reference to the sequence listing part.

[44133] VGAM3155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3155 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44134] VGAM3155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3155 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3155 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44135] The complementary binding of VGAM3155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3155

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44136] It is appreciated that VGAM3155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3155 host target genes. The mRNA of each one of this plurality of VGAM3155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3155 RNA, herein designated VGAM RNA, and which when bound by VGAM3155 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3155 host target proteins.

[44137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3155 gene, herein designated VGAM GENE, on one or more VGAM3155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44138] It is yet further appreciated that a function of VGAM3155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3155 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3155 correlate with, and may be deduced from, the identity of the host target genes which VGAM3155 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44139] Nucleotide sequences of the VGAM3155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3155 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3155 are further described hereinbelow with reference to Table 1.

[44140] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44141] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3156 (VGAM3156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44142] VGAM3156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3156 was detected is described hereinabove with reference to Figs. 2-8.

[44143] VGAM3156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia paramyxovirus. VGAM3156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[44144] VGAM3156 gene, herein designated VGAM GENE, encodes a VGAM3156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3156 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3156 precursor RNA is designated SEQ ID:71590, and is provided hereinbelow with reference to the sequence listing part.

[44145] VGAM3156 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44146] An enzyme complex designated DICER COMPLEX, dices the VGAM3156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3156 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3156 RNA is designated SEQ ID:71591, and is provided hereinbelow with reference to the sequence listing part.

[44147] VGAM3156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3156 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44148] VGAM3156 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3156 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44149] The complementary binding of VGAM3156 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3156 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44150] It is appreciated that VGAM3156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3156 host target genes. The mRNA of each one of this plurality of VGAM3156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3156 RNA, herein designated VGAM RNA, and which when bound by VGAM3156 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3156 host target proteins.

[44151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3156 gene, herein designated VGAM GENE, on one or more VGAM3156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44152] It is yet further appreciated that a function of VGAM3156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3156 include diagnosis, prevention and treatment of viral infection by Tupaia paramyxovirus. Specific functions, and accordingly utilities, of VGAM3156 correlate with, and may be deduced from, the identity of the host target genes which VGAM3156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44153] Nucleotide sequences of the VGAM3156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3156 are further

described hereinbelow with reference to Table 1.

[44154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44155] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3157 (VGAM3157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44156] VGAM3157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3157 was detected is described hereinabove with reference to Figs. 2-8.

[44157] VGAM3157 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cycas necrotic stunt virus. VGAM3157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44158] VGAM3157 gene, herein designated VGAM GENE, encodes a VGAM3157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3157 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3157 precursor RNA is designated SEQ ID:71606, and is provided hereinbelow with reference to the sequence listing part.

[44159] VGAM3157 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44160] An enzyme complex designated DICER COMPLEX, dices the VGAM3157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3157 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3157 RNA is designated SEQ ID:71607, and is provided hereinbelow with reference to the sequence listing part.

[44161] VGAM3157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44162] VGAM3157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3157 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44163] The complementary binding of VGAM3157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3157 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3157 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44164] It is appreciated that VGAM3157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3157 host target genes. The mRNA of each one of this plurality of VGAM3157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3157 RNA, herein designated VGAM RNA, and which when bound by VGAM3157 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3157 host target proteins.

[44165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3157 gene, herein designated VGAM GENE, on one or more VGAM3157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44166] It is yet further appreciated that a function of VGAM3157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3157 include diagnosis, prevention and treatment of viral infection by Cycas necrotic stunt virus. Specific functions, and accordingly utilities, of VGAM3157 correlate with, and may be deduced from, the identity of the host target genes which VGAM3157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44167] Nucleotide sequences of the VGAM3157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3157 are further described hereinbelow with reference to Table 1.

[44168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44169] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3158 (VGAM3158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44170] VGAM3158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3158 was detected is described hereinabove with reference to Figs. 2-8.

[44171] VGAM3158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hop latent virus. VGAM3158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44172] VGAM3158 gene, herein designated VGAM GENE, encodes

a VGAM3158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3158 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3158 precursor RNA is designated SEQ ID:71619, and is provided hereinbelow with reference to the sequence listing part.

[44173] VGAM3158 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44174] An enzyme complex designated DICER COMPLEX, dices the VGAM3158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3158 RNA is designated SEQ ID:71620, and is provided hereinbelow with reference to the sequence listing part.

[44175] VGAM3158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44176] VGAM3158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3158 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44177] The complementary binding of VGAM3158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3158 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3158 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[44178] It is appreciated that VGAM3158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3158 host target genes. The mRNA of each one of this plurality of VGAM3158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3158 RNA, herein designated VGAM RNA, and which when bound by VGAM3158 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3158 host target proteins.

[44179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3158 gene, herein designated VGAM GENE, on one or more VGAM3158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44180] It is yet further appreciated that a function of VGAM3158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3158 include diagnosis, prevention and treatment of viral infection by Hop latent virus. Specific functions, and accordingly utilities, of VGAM3158 correlate with, and may be deduced from, the identity of the host target genes which VGAM3158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44181] Nucleotide sequences of the VGAM3158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3158 are further described hereinbelow with reference to Table 1.

[44182] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44183] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3159 (VGAM3159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44184] VGAM3159 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3159 was detected is described hereinabove with reference to Figs. 2-8.

[44185] VGAM3159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM3159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44186] VGAM3159 gene, herein designated VGAM GENE, encodes a VGAM3159 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3159 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3159 precursor RNA is designated SEQ ID:71640, and is provided hereinbelow with reference to the sequence listing part.

[44187] VGAM3159 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44188] An enzyme complex designated DICER COMPLEX, dices the VGAM3159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3159 RNA is designated SEQ ID:71641, and is provided hereinbelow with reference to the sequence listing part.

[44189] VGAM3159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44190] VGAM3159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3159 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44191] The complementary binding of VGAM3159 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3159 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44192] It is appreciated that VGAM3159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3159 host target genes. The mRNA of each one of this plurality of VGAM3159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3159 RNA, herein designated VGAM RNA, and which when bound by VGAM3159 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3159 host target proteins.

[44193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3159 gene, herein designated VGAM GENE, on one or more VGAM3159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44194] It is yet further appreciated that a function of VGAM3159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3159 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM3159 correlate with, and may be deduced from, the identity of the host target genes which VGAM3159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44195] Nucleotide sequences of the VGAM3159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3159 are further described hereinbelow with reference to Table 1.

[44196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44197] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3160 (VGAM3160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44198] VGAM3160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3160 was detected is described hereinabove with reference to Figs. 2-8.

[44199] VGAM3160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit oral papillomavirus. VGAM3160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44200] VGAM3160 gene, herein designated VGAM GENE, encodes a VGAM3160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3160 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3160 precursor RNA is designated SEQ ID:71660, and is provided hereinbelow with reference to the sequence listing part.

[44201] VGAM3160 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44202] An enzyme complex designated DICER COMPLEX, dices the VGAM3160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3160 RNA is designated SEQ ID:71661, and is provided hereinbelow with reference to the sequence listing part.

[44203] VGAM3160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44204] VGAM3160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3160 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44205] The complementary binding of VGAM3160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3160 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44206] It is appreciated that VGAM3160 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3160 host target genes. The mRNA of each one of this plurality of VGAM3160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3160 RNA, herein designated VGAM RNA, and which when bound by VGAM3160 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3160 host target proteins.

[44207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3160 gene, herein designated VGAM GENE, on one or more VGAM3160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44208] It is yet further appreciated that a function of VGAM3160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3160 include diagnosis, prevention and treatment of viral infection by Rabbit oral papillomavirus. Specific functions, and accordingly utilities, of VGAM3160 correlate with, and may be deduced from, the identity of the host target genes which VGAM3160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44209] Nucleotide sequences of the VGAM3160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3160 are further described hereinbelow with reference to Table 1.

[44210] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44211] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3161 (VGAM3161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44212] VGAM3161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3161 was detected is described hereinabove with reference to Figs. 2–8.

[44213] VGAM3161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44214] VGAM3161 gene, herein designated VGAM GENE, encodes a VGAM3161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3161 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3161 precursor RNA is designated SEQ ID:71679, and is provided hereinbelow with reference to the sequence listing part.

[44215] VGAM3161 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44216] An enzyme complex designated DICER COMPLEX, dices the VGAM3161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3161 RNA is designated SEQ ID:71680, and is provided hereinbelow with reference to the sequence listing part.

[44217] VGAM3161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44218] VGAM3161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3161 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44219] The complementary binding of VGAM3161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3161 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44220] It is appreciated that VGAM3161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3161 host target genes. The mRNA of each one of this plurality of VGAM3161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3161 RNA, herein designated VGAM RNA, and which when bound by VGAM3161 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3161 host target proteins.

[44221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3161 gene, herein designated VGAM GENE, on one or more VGAM3161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [44222] It is yet further appreciated that a function of VGAM3161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3161 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3161 correlate with, and may be deduced from, the identity of the host target genes which VGAM3161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [44223] Nucleotide sequences of the VGAM3161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3161 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3161 are further described hereinbelow with reference to Table 1.
- [44224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44225] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3162 (VGAM3162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44226] VGAM3162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3162 was detected is described hereinabove with reference to Figs. 2–8.

[44227] VGAM3162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry virus A. VGAM3162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44228] VGAM3162 gene, herein designated VGAM GENE, encodes a VGAM3162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3162 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3162 precursor RNA is designated SEQ ID:71750, and is provided hereinbelow with reference to the sequence listing part.

[44229] VGAM3162 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44230] An enzyme complex designated DICER COMPLEX, dices the VGAM3162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3162 RNA is designated SEQ ID:71751, and is provided hereinbelow with reference to the sequence listing part.

[44231] VGAM3162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44232] VGAM3162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3162 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44233] The complementary binding of VGAM3162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3162 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44234] It is appreciated that VGAM3162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3162 host target genes. The mRNA of

each one of this plurality of VGAM3162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3162 RNA, herein designated VGAM RNA, and which when bound by VGAM3162 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3162 host target proteins.

[44235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3162 gene, herein designated VGAM GENE, on one or more VGAM3162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[44236] It is yet further appreciated that a function of VGAM3162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3162 include diagnosis, prevention and treatment of viral infection by Cherry virus A. Specific functions, and accordingly utilities, of VGAM3162 correlate with, and may be deduced from, the identity of the host target genes which VGAM3162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44237] Nucleotide sequences of the VGAM3162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3162 are further described hereinbelow with reference to Table 1.

[44238] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3162 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[44239] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3163 (VGAM3163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44240] VGAM3163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3163 was detected is described hereinabove with reference to Figs. 2–8.

[44241] VGAM3163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM3163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44242] VGAM3163 gene, herein designated VGAM GENE, encodes a VGAM3163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3163 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3163 precursor RNA is designated SEQ ID:71760, and is provided hereinbelow with reference to the sequence listing part.

[44243] VGAM3163 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44244] An enzyme complex designated DICER COMPLEX, dices the VGAM3163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3163 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3163 RNA is designated SEQ ID:71761,

and is provided hereinbelow with reference to the sequence listing part.

[44245] VGAM3163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44246] VGAM3163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3163 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44247] The complementary binding of VGAM3163 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3163 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44248] It is appreciated that VGAM3163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3163 host target genes. The mRNA of each one of this plurality of VGAM3163 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3163 RNA, herein designated VGAM RNA, and which when bound by VGAM3163 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3163 host target proteins.

[44249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3163 gene, herein designated VGAM GENE, on one or more VGAM3163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44250] It is yet further appreciated that a function of VGAM3163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3163 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3163 correlate with, and may be deduced from, the identity of the host target genes which VGAM3163 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44251] Nucleotide sequences of the VGAM3163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3163 are further described hereinbelow with reference to Table 1.

[44252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44253] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3164 (VGAM3164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44254] VGAM3164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3164 was detected is described hereinabove with reference to Figs. 2–8.

[44255] VGAM3164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM3164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44256] VGAM3164 gene, herein designated VGAM GENE, encodes a VGAM3164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3164 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3164 precursor

sor RNA is designated SEQ ID:71770, and is provided hereinbelow with reference to the sequence listing part.

[44257] VGAM3164 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44258] An enzyme complex designated DICER COMPLEX, dices the VGAM3164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3164 RNA is designated SEQ ID:71771, and is provided hereinbelow with reference to the se-

quence listing part.

[44259] VGAM3164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44260] VGAM3164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3164 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44261] The complementary binding of VGAM3164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3164 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44262] It is appreciated that VGAM3164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3164 host target genes. The mRNA of each one of this plurality of VGAM3164 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3164 RNA, herein designated VGAM RNA, and which when bound by VGAM3164 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3164 host target proteins.

[44263] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3164 gene, herein designated VGAM GENE, on one or more VGAM3164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44264] It is yet further appreciated that a function of VGAM3164

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3164 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3164 correlate with, and may be deduced from, the identity of the host target genes which VGAM3164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44265] Nucleotide sequences of the VGAM3164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3164 are further described hereinbelow with reference to Table 1.

[44266] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44267] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3165 (VGAM3165) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44268] VGAM3165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3165 was detected is described hereinabove with reference to Figs. 2–8.

[44269] VGAM3165 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Giardia lamblia virus. VGAM3165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44270] VGAM3165 gene, herein designated VGAM GENE, encodes a VGAM3165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3165 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3165 precursor RNA is designated SEQ ID:71807, and is provided

hereinbelow with reference to the sequence listing part.

[44271] VGAM3165 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44272] An enzyme complex designated DICER COMPLEX, dices the VGAM3165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3165 RNA is designated SEQ ID:71808, and is provided hereinbelow with reference to the sequence listing part.

[44273] VGAM3165 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44274] VGAM3165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3165 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3165 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44275] The complementary binding of VGAM3165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3165 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44276] It is appreciated that VGAM3165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3165 host target genes. The mRNA of each one of this plurality of VGAM3165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3165 RNA, herein designated VGAM RNA, and which when bound by VGAM3165 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3165 host target proteins.

[44277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3165 gene, herein designated VGAM GENE, on one or more VGAM3165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44278] It is yet further appreciated that a function of VGAM3165 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3165 include diagnosis, prevention and treatment of viral infection by Giardia lamblia virus. Specific functions, and accordingly utilities, of VGAM3165 correlate with, and may be deduced from, the identity of the host target genes which VGAM3165 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44279] Nucleotide sequences of the VGAM3165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3165 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3165 are further described hereinbelow with reference to Table 1.

[44280] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44281] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3166 (VGAM3166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44282] VGAM3166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3166 was detected is described hereinabove with reference to Figs. 2–8.

[44283] VGAM3166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44284] VGAM3166 gene, herein designated VGAM GENE, encodes a VGAM3166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3166 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3166 precursor RNA is designated SEQ ID:71827, and is provided hereinbelow with reference to the sequence listing part.

[44285] VGAM3166 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44286] An enzyme complex designated DICER COMPLEX, dices the VGAM3166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3166 RNA is designated SEQ ID:71828, and is provided hereinbelow with reference to the sequence listing part.

[44287] VGAM3166 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44288] VGAM3166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3166 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3166 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44289] The complementary binding of VGAM3166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3166 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44290] It is appreciated that VGAM3166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3166 host target genes. The mRNA of each one of this plurality of VGAM3166 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3166 RNA, herein designated VGAM

RNA, and which when bound by VGAM3166 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3166 host target proteins.

[44291] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3166 gene, herein designated VGAM GENE, on one or more VGAM3166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44292] It is yet further appreciated that a function of VGAM3166 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3166 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3166 correlate with, and may be deduced from, the identity of the host target genes which VGAM3166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44293] Nucleotide sequences of the VGAM3166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3166 are further described hereinbelow with reference to Table 1.

[44294] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44295] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3167 (VGAM3167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44296] VGAM3167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3167 was detected is described hereinabove with reference to Figs. 2-8.

[44297] VGAM3167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44298] VGAM3167 gene, herein designated VGAM GENE, encodes a VGAM3167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3167 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3167 precursor RNA is designated SEQ ID:71830, and is provided hereinbelow with reference to the sequence listing part.

[44299] VGAM3167 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44300] An enzyme complex designated DICER COMPLEX, dices the VGAM3167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3167 RNA is designated SEQ ID:71831, and is provided hereinbelow with reference to the sequence listing part.

[44301] VGAM3167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3167 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44302] VGAM3167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3167 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3167 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44303] The complementary binding of VGAM3167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3167 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3167 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44304] It is appreciated that VGAM3167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3167 host target genes. The mRNA of each one of this plurality of VGAM3167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3167 RNA, herein designated VGAM RNA, and which when bound by VGAM3167 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3167 host target proteins.

[44305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3167 gene, herein designated VGAM GENE, on one or more VGAM3167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44306] It is yet further appreciated that a function of VGAM3167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3167 include diagnosis, prevention and

treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3167 correlate with, and may be deduced from, the identity of the host target genes which VGAM3167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44307] Nucleotide sequences of the VGAM3167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3167 are further described hereinbelow with reference to Table 1.

[44308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44309] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3168 (VGAM3168) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44310] VGAM3168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3168 was detected is described hereinabove with reference to Figs. 2–8.

[44311] VGAM3168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44312] VGAM3168 gene, herein designated VGAM GENE, encodes a VGAM3168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3168 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3168 precursor RNA is designated SEQ ID:71834, and is provided hereinbelow with reference to the sequence listing part.

[44313] VGAM3168 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3168 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44314] An enzyme complex designated DICER COMPLEX, dices the VGAM3168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3168 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3168 RNA is designated SEQ ID:71835, and is provided hereinbelow with reference to the sequence listing part.

[44315] VGAM3168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3168 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3168 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44316] VGAM3168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3168 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3168 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44317] The complementary binding of VGAM3168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3168 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44318] It is appreciated that VGAM3168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3168 host target genes. The mRNA of each one of this plurality of VGAM3168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3168 RNA, herein designated VGAM RNA, and which when bound by VGAM3168 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3168 host target proteins.

[44319] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3168 gene, herein designated VGAM GENE, on one or more VGAM3168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44320] It is yet further appreciated that a function of VGAM3168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3168 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM3168 correlate with, and may be deduced from, the identity of the host target genes which VGAM3168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44321] Nucleotide sequences of the VGAM3168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3168 are further described hereinbelow with reference to Table 1.

[44322] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44323] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3169 (VGAM3169) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[44324] VGAM3169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3169 was detected is described hereinabove with reference to Figs. 2–8.

[44325] VGAM3169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44326] VGAM3169 gene, herein designated VGAM GENE, encodes a VGAM3169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3169 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3169 precursor RNA is designated SEQ ID:71849, and is provided hereinbelow with reference to the sequence listing part.

[44327] VGAM3169 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44328] An enzyme complex designated DICER COMPLEX, dices the VGAM3169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3169 RNA is designated SEQ ID:71850, and is provided hereinbelow with reference to the sequence listing part.

[44329] VGAM3169 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44330] VGAM3169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3169 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44331] The complementary binding of VGAM3169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3169 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44332] It is appreciated that VGAM3169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3169 host target genes. The mRNA of each one of this plurality of VGAM3169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3169 RNA, herein designated VGAM RNA, and which when bound by VGAM3169 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3169 host target proteins.

[44333] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3169 gene, herein designated VGAM GENE, on one or more VGAM3169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44334] It is yet further appreciated that a function of VGAM3169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3169 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3169 correlate with, and may be deduced from, the identity of the host

target genes which VGAM3169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44335] Nucleotide sequences of the VGAM3169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3169 are further described hereinbelow with reference to Table 1.

[44336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44337] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3170 (VGAM3170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44338] VGAM3170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3170 was detected is described hereinabove with reference to Figs. 2–8.

[44339] VGAM3170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44340] VGAM3170 gene, herein designated VGAM GENE, encodes a VGAM3170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3170 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3170 precursor RNA is designated SEQ ID:71866, and is provided hereinbelow with reference to the sequence listing part.

[44341] VGAM3170 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44342] An enzyme complex designated DICER COMPLEX, dices the VGAM3170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3170 RNA is designated SEQ ID:71867, and is provided hereinbelow with reference to the sequence listing part.

[44343] VGAM3170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44344] VGAM3170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3170 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44345] The complementary binding of VGAM3170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3170 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3170 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44346] It is appreciated that VGAM3170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3170 host target genes. The mRNA of each one of this plurality of VGAM3170 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3170 RNA, herein designated VGAM RNA, and which when bound by VGAM3170 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3170 host target proteins.

[44347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3170 gene, herein designated VGAM GENE, on one or more VGAM3170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44348] It is yet further appreciated that a function of VGAM3170 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3170 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3170 correlate with, and may be deduced from, the identity of the host target genes which VGAM3170 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[44349] Nucleotide sequences of the VGAM3170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3170 are further described hereinbelow with reference to Table 1.

[44350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44351] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3171 (VGAM3171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44352] VGAM3171 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3171 was detected is described hereinabove with reference to Figs. 2–8.

[44353] VGAM3171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foxtail mosaic virus. VGAM3171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44354] VGAM3171 gene, herein designated VGAM GENE, encodes a VGAM3171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3171 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3171 precursor RNA is designated SEQ ID:71930, and is provided hereinbelow with reference to the sequence listing part.

[44355] VGAM3171 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44356] An enzyme complex designated DICER COMPLEX, dices the VGAM3171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3171 RNA is designated SEQ ID:71931, and is provided hereinbelow with reference to the sequence listing part.

[44357] VGAM3171 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44358] VGAM3171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3171 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3171 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[44359] The complementary binding of VGAM3171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3171 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44360] It is appreciated that VGAM3171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3171 host target genes. The mRNA of each one of this plurality of VGAM3171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3171 RNA, herein designated VGAM RNA, and which when bound by VGAM3171 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3171 host target proteins.

[44361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3171 gene, herein designated VGAM GENE, on one or more VGAM3171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44362] It is yet further appreciated that a function of VGAM3171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3171 include diagnosis, prevention and treatment of viral infection by Foxtail mosaic virus. Specific functions, and accordingly utilities, of VGAM3171 correlate with, and may be deduced from, the identity of the host target genes which VGAM3171 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[44363] Nucleotide sequences of the VGAM3171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3171 are further described hereinbelow with reference to Table 1.

[44364] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44365] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3172 (VGAM3172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44366] VGAM3172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3172 was detected is described hereinabove with reference to Figs. 2–8.

[44367] VGAM3172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foxtail mosaic virus. VGAM3172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44368] VGAM3172 gene, herein designated VGAM GENE, encodes a VGAM3172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3172 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3172 precursor RNA is designated SEQ ID:71966, and is provided hereinbelow with reference to the sequence listing part.

[44369] VGAM3172 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44370] An enzyme complex designated DICER COMPLEX, dices the VGAM3172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3172 RNA is designated SEQ ID:71967, and is provided hereinbelow with reference to the sequence listing part.

[44371] VGAM3172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[44372] VGAM3172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3172 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44373] The complementary binding of VGAM3172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3172 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44374] It is appreciated that VGAM3172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3172 host target genes. The mRNA of each one of this plurality of VGAM3172 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3172 RNA, herein designated VGAM RNA, and which when bound by VGAM3172 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3172 host target proteins.

[44375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3172 gene, herein designated VGAM GENE, on one

or more VGAM3172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44376] It is yet further appreciated that a function of VGAM3172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3172 include diagnosis, prevention and treatment of viral infection by Foxtail mosaic virus. Specific functions, and accordingly utilities, of VGAM3172 correlate with, and may be deduced from, the identity of the host target genes which VGAM3172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44377] Nucleotide sequences of the VGAM3172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3172 are further described hereinbelow with reference to Table 1.

[44378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3172 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44379] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3173 (VGAM3173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44380] VGAM3173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3173 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[44381] VGAM3173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44382] VGAM3173 gene, herein designated VGAM GENE, encodes a VGAM3173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3173 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3173 precursor RNA is designated SEQ ID:71984, and is provided hereinbelow with reference to the sequence listing part.

[44383] VGAM3173 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44384] An enzyme complex designated DICER COMPLEX, dices the VGAM3173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3173 RNA is designated SEQ ID:71985, and is provided hereinbelow with reference to the sequence listing part.

[44385] VGAM3173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44386] VGAM3173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3173 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44387] The complementary binding of VGAM3173 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3173 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44388] It is appreciated that VGAM3173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3173 host target genes. The mRNA of each one of this plurality of VGAM3173 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3173 RNA, herein designated VGAM RNA, and which when bound by VGAM3173 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3173 host target proteins.

[44389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3173 gene, herein designated VGAM GENE, on one or more VGAM3173 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44390] It is yet further appreciated that a function of VGAM3173 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3173 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM3173 correlate with, and may be deduced from, the identity of the host target genes which VGAM3173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44391] Nucleotide sequences of the VGAM3173 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3173 are further described hereinbelow with reference to Table 1.

[44392] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44393] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3174 (VGAM3174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44394] VGAM3174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3174 was detected is described hereinabove with reference to Figs. 2-8.

[44395] VGAM3174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44396] VGAM3174 gene, herein designated VGAM GENE, encodes a VGAM3174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3174 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3174 precursor RNA is designated SEQ ID:71996, and is provided hereinbelow with reference to the sequence listing part.

[44397] VGAM3174 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[44398] An enzyme complex designated DICER COMPLEX, dices the VGAM3174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3174 RNA is designated SEQ ID:71997, and is provided hereinbelow with reference to the sequence listing part.

[44399] VGAM3174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44400] VGAM3174 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3174 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44401] The complementary binding of VGAM3174 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3174 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44402] It is appreciated that VGAM3174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3174 host target genes. The mRNA of each one of this plurality of VGAM3174 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3174 RNA, herein designated VGAM RNA, and which when bound by VGAM3174 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3174 host target proteins.

[44403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3174 gene, herein designated VGAM GENE, on one or more VGAM3174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44404] It is yet further appreciated that a function of VGAM3174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3174 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM3174 correlate with, and may be deduced from, the identity of the host target genes which VGAM3174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44405] Nucleotide sequences of the VGAM3174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3174 are further described hereinbelow with reference to Table 1.

[44406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44407] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3175 (VGAM3175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44408] VGAM3175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3175 was detected is described hereinabove with reference to Figs. 2-8.

[44409] VGAM3175 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Porcine epidemic diarrhea virus. VGAM3175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44410] VGAM3175 gene, herein designated VGAM GENE, encodes a VGAM3175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3175 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3175 precursor RNA is designated SEQ ID:72035, and is provided hereinbelow with reference to the sequence listing part.

[44411] VGAM3175 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44412] An enzyme complex designated DICER COMPLEX, dices the VGAM3175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3175 RNA is designated SEQ ID:72036, and is provided hereinbelow with reference to the sequence listing part.

[44413] VGAM3175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3175 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44414] VGAM3175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3175 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44415] The complementary binding of VGAM3175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3175 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3175 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44416] It is appreciated that VGAM3175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3175 host target genes. The mRNA of each one of this plurality of VGAM3175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3175 RNA, herein designated VGAM RNA, and which when bound by VGAM3175 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3175 host target proteins.

[44417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3175 gene, herein designated VGAM GENE, on one or more VGAM3175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44418] It is yet further appreciated that a function of VGAM3175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3175 include diagnosis, prevention and treatment of viral infection by Porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM3175 correlate with, and may be deduced from, the identity of the host target genes which VGAM3175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44419] Nucleotide sequences of the VGAM3175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3175 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3175 are further described hereinbelow with reference to Table 1.

[44420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44421] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3176 (VGAM3176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44422] VGAM3176 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3176 was detected is described hereinabove with reference to Figs. 2-8.

[44423] VGAM3176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3176

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44424] VGAM3176 gene, herein designated VGAM GENE, encodes a VGAM3176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3176 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3176 precursor RNA is designated SEQ ID:72052, and is provided hereinbelow with reference to the sequence listing part.

[44425] VGAM3176 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44426] An enzyme complex designated DICER COMPLEX, dices the VGAM3176 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3176 RNA is designated SEQ ID:72053, and is provided hereinbelow with reference to the sequence listing part.

[44427] VGAM3176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3176 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3176 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44428] VGAM3176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3176 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3176 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44429] The complementary binding of VGAM3176 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3176

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3176 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44430] It is appreciated that VGAM3176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3176 host target genes. The mRNA of each one of this plurality of VGAM3176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3176 RNA, herein designated VGAM RNA, and which when bound by VGAM3176 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3176 host target proteins.

[44431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3176 gene, herein designated VGAM GENE, on one or more VGAM3176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44432] It is yet further appreciated that a function of VGAM3176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3176 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3176 correlate with, and may be deduced from, the identity of the host target genes which VGAM3176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44433] Nucleotide sequences of the VGAM3176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3176 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3176 are further described hereinbelow with reference to Table 1.

[44434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44435] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3177 (VGAM3177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44436] VGAM3177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3177 was detected is described hereinabove with reference to Figs. 2-8.

[44437] VGAM3177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM3177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[44438] VGAM3177 gene, herein designated VGAM GENE, encodes a VGAM3177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3177 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3177 precursor RNA is designated SEQ ID:72056, and is provided hereinbelow with reference to the sequence listing part.

[44439] VGAM3177 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44440] An enzyme complex designated DICER COMPLEX, dices the VGAM3177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3177 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3177 RNA is designated SEQ ID:72057, and is provided hereinbelow with reference to the sequence listing part.

[44441] VGAM3177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3177 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44442] VGAM3177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3177 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3177 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44443] The complementary binding of VGAM3177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3177 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44444] It is appreciated that VGAM3177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3177 host target genes. The mRNA of each one of this plurality of VGAM3177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3177 RNA, herein designated VGAM RNA, and which when bound by VGAM3177 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3177 host target proteins.

[44445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3177 gene, herein designated VGAM GENE, on one or more VGAM3177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44446] It is yet further appreciated that a function of VGAM3177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3177 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM3177 correlate with, and may be deduced from, the identity of the host target genes which VGAM3177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44447] Nucleotide sequences of the VGAM3177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3177 are further

described hereinbelow with reference to Table 1.

[44448] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44449] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3178 (VGAM3178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44450] VGAM3178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3178 was detected is described hereinabove with reference to Figs. 2-8.

[44451] VGAM3178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3178 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44452] VGAM3178 gene, herein designated VGAM GENE, encodes a VGAM3178 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3178 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3178 precursor RNA is designated SEQ ID:72069, and is provided hereinbelow with reference to the sequence listing part.

[44453] VGAM3178 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44454] An enzyme complex designated DICER COMPLEX, dices the VGAM3178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3178 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3178 RNA is designated SEQ ID:72070, and is provided hereinbelow with reference to the sequence listing part.

[44455] VGAM3178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44456] VGAM3178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3178 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44457] The complementary binding of VGAM3178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3178 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3178 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44458] It is appreciated that VGAM3178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3178 host target genes. The mRNA of each one of this plurality of VGAM3178 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3178 RNA, herein designated VGAM RNA, and which when bound by VGAM3178 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3178 host target proteins.

[44459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3178 gene, herein designated VGAM GENE, on one or more VGAM3178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44460] It is yet further appreciated that a function of VGAM3178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3178 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3178 correlate with, and may be deduced from, the identity of the host target genes which VGAM3178 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44461] Nucleotide sequences of the VGAM3178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3178 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3178 are further described hereinbelow with reference to Table 1.

[44462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3178 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44463] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3179 (VGAM3179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44464] VGAM3179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3179 was detected is described hereinabove with reference to Figs. 2-8.

[44465] VGAM3179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM3179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44466] VGAM3179 gene, herein designated VGAM GENE, encodes

a VGAM3179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3179 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3179 precursor RNA is designated SEQ ID:72084, and is provided hereinbelow with reference to the sequence listing part.

[44467] VGAM3179 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44468] An enzyme complex designated DICER COMPLEX, dices the VGAM3179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3179 RNA is designated SEQ ID:72085, and is provided hereinbelow with reference to the sequence listing part.

[44469] VGAM3179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44470] VGAM3179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3179 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44471] The complementary binding of VGAM3179 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3179 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[44472] It is appreciated that VGAM3179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3179 host target genes. The mRNA of each one of this plurality of VGAM3179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3179 RNA, herein designated VGAM RNA, and which when bound by VGAM3179 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3179 host target proteins.

[44473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3179 gene, herein designated VGAM GENE, on one or more VGAM3179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44474] It is yet further appreciated that a function of VGAM3179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3179 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM3179 correlate with, and may be deduced from, the identity of the host target genes which VGAM3179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44475] Nucleotide sequences of the VGAM3179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3179 are further described hereinbelow with reference to Table 1.

[44476] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44477] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3180 (VGAM3180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44478] VGAM3180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3180 was detected is described hereinabove with reference to Figs. 2-8.

[44479] VGAM3180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM3180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44480] VGAM3180 gene, herein designated VGAM GENE, encodes a VGAM3180 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3180 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3180 precursor RNA is designated SEQ ID:72105, and is provided hereinbelow with reference to the sequence listing part.

[44481] VGAM3180 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44482] An enzyme complex designated DICER COMPLEX, dices the VGAM3180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3180 RNA is designated SEQ ID:72106, and is provided hereinbelow with reference to the sequence listing part.

[44483] VGAM3180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44484] VGAM3180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3180 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44485] The complementary binding of VGAM3180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3180 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3180 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44486] It is appreciated that VGAM3180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3180 host target genes. The mRNA of each one of this plurality of VGAM3180 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3180 RNA, herein designated VGAM RNA, and which when bound by VGAM3180 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3180 host target proteins.

[44487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3180 gene, herein designated VGAM GENE, on one or more VGAM3180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44488] It is yet further appreciated that a function of VGAM3180 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3180 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM3180 correlate with, and may be deduced from, the identity of the host target genes which VGAM3180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44489] Nucleotide sequences of the VGAM3180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3180 are further described hereinbelow with reference to Table 1.

[44490] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44491] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3181 (VGAM3181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44492] VGAM3181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3181 was detected is described hereinabove with reference to Figs. 2-8.

[44493] VGAM3181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 13. VGAM3181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44494] VGAM3181 gene, herein designated VGAM GENE, encodes a VGAM3181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3181 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3181 precursor RNA is designated SEQ ID:72111, and is provided hereinbelow with reference to the sequence listing part.

[44495] VGAM3181 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44496] An enzyme complex designated DICER COMPLEX, dices the VGAM3181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3181 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3181 RNA is designated SEQ ID:72112, and is provided hereinbelow with reference to the sequence listing part.

[44497] VGAM3181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44498] VGAM3181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3181 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44499] The complementary binding of VGAM3181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3181 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44500] It is appreciated that VGAM3181 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3181 host target genes. The mRNA of each one of this plurality of VGAM3181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3181 RNA, herein designated VGAM RNA, and which when bound by VGAM3181 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3181 host target proteins.

[44501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3181 gene, herein designated VGAM GENE, on one or more VGAM3181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44502] It is yet further appreciated that a function of VGAM3181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3181 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 13. Specific functions, and accordingly utilities, of VGAM3181 correlate with, and may be deduced from, the identity of the host target genes which VGAM3181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44503] Nucleotide sequences of the VGAM3181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3181 are further described hereinbelow with reference to Table 1.

[44504] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44505] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3182 (VGAM3182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44506] VGAM3182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3182 was detected is described hereinabove with reference to Figs. 2–8.

[44507] VGAM3182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 21. VGAM3182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44508] VGAM3182 gene, herein designated VGAM GENE, encodes a VGAM3182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3182 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3182 precursor RNA is designated SEQ ID:72120, and is provided hereinbelow with reference to the sequence listing part.

[44509] VGAM3182 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44510] An enzyme complex designated DICER COMPLEX, dices the VGAM3182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3182 RNA is designated SEQ ID:72121, and is provided hereinbelow with reference to the sequence listing part.

[44511] VGAM3182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44512] VGAM3182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3182 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44513] The complementary binding of VGAM3182 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3182 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44514] It is appreciated that VGAM3182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3182 host target genes. The mRNA of each one of this plurality of VGAM3182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3182 RNA, herein designated VGAM RNA, and which when bound by VGAM3182 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3182 host target proteins.

[44515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3182 gene, herein designated VGAM GENE, on one or more VGAM3182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [44516] It is yet further appreciated that a function of VGAM3182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3182 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 21. Specific functions, and accordingly utilities, of VGAM3182 correlate with, and may be deduced from, the identity of the host target genes which VGAM3182 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [44517] Nucleotide sequences of the VGAM3182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3182 are further described hereinbelow with reference to Table 1.
- [44518] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44519] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3183 (VGAM3183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44520] VGAM3183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3183 was detected is described hereinabove with reference to Figs. 2–8.

[44521] VGAM3183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 21. VGAM3183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44522] VGAM3183 gene, herein designated VGAM GENE, encodes a VGAM3183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3183 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3183 precursor RNA is designated SEQ ID:72142, and is provided hereinbelow with reference to the sequence listing part.

[44523] VGAM3183 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44524] An enzyme complex designated DICER COMPLEX, dices the VGAM3183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3183 RNA is designated SEQ ID:72143, and is provided hereinbelow with reference to the sequence listing part.

[44525] VGAM3183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44526] VGAM3183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3183 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44527] The complementary binding of VGAM3183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3183 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44528] It is appreciated that VGAM3183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3183 host target genes. The mRNA of

each one of this plurality of VGAM3183 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3183 RNA, herein designated VGAM RNA, and which when bound by VGAM3183 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3183 host target proteins.

[44529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3183 gene, herein designated VGAM GENE, on one or more VGAM3183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[44530] It is yet further appreciated that a function of VGAM3183 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3183 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 21. Specific functions, and accordingly utilities, of VGAM3183 correlate with, and may be deduced from, the identity of the host target genes which VGAM3183 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44531] Nucleotide sequences of the VGAM3183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3183 are further described hereinbelow with reference to Table 1.

[44532] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3183 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[44533] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3184 (VGAM3184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44534] VGAM3184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3184 was detected is described hereinabove with reference to Figs. 2–8.

[44535] VGAM3184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 20. VGAM3184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44536] VGAM3184 gene, herein designated VGAM GENE, encodes a VGAM3184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3184 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3184 precursor RNA is designated SEQ ID:72188, and is provided hereinbelow with reference to the sequence listing part.

[44537] VGAM3184 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44538] An enzyme complex designated DICER COMPLEX, dices the VGAM3184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3184 RNA is designated SEQ ID:72189,

and is provided hereinbelow with reference to the sequence listing part.

[44539] VGAM3184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44540] VGAM3184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3184 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44541] The complementary binding of VGAM3184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3184 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44542] It is appreciated that VGAM3184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3184 host target genes. The mRNA of each one of this plurality of VGAM3184 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3184 RNA, herein designated VGAM RNA, and which when bound by VGAM3184 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3184 host target proteins.

[44543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3184 gene, herein designated VGAM GENE, on one or more VGAM3184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44544] It is yet further appreciated that a function of VGAM3184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3184 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 20. Specific functions, and accordingly utilities, of VGAM3184 correlate with, and may be deduced from, the identity of the host target genes which VGAM3184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44545] Nucleotide sequences of the VGAM3184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3184 are further described hereinbelow with reference to Table 1.

[44546] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44547] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3185 (VGAM3185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44548] VGAM3185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3185 was detected is described hereinabove with reference to Figs. 2–8.

[44549] VGAM3185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44550] VGAM3185 gene, herein designated VGAM GENE, encodes a VGAM3185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3185 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3185 precu-

sor RNA is designated SEQ ID:72203, and is provided hereinbelow with reference to the sequence listing part.

[44551] VGAM3185 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44552] An enzyme complex designated DICER COMPLEX, dices the VGAM3185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3185 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3185 RNA is designated SEQ ID:72204, and is provided hereinbelow with reference to the se-

quence listing part.

[44553] VGAM3185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44554] VGAM3185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3185 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44555] The complementary binding of VGAM3185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3185 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44556] It is appreciated that VGAM3185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3185 host target genes. The mRNA of each one of this plurality of VGAM3185 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3185 RNA, herein designated VGAM RNA, and which when bound by VGAM3185 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3185 host target proteins.

[44557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3185 gene, herein designated VGAM GENE, on one or more VGAM3185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44558] It is yet further appreciated that a function of VGAM3185

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3185 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3185 correlate with, and may be deduced from, the identity of the host target genes which VGAM3185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44559] Nucleotide sequences of the VGAM3185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3185 are further described hereinbelow with reference to Table 1.

[44560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44561] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3186 (VGAM3186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44562] VGAM3186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3186 was detected is described hereinabove with reference to Figs. 2–8.

[44563] VGAM3186 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44564] VGAM3186 gene, herein designated VGAM GENE, encodes a VGAM3186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3186 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3186 precursor RNA is designated SEQ ID:72217, and is provided

hereinbelow with reference to the sequence listing part.

[44565] VGAM3186 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44566] An enzyme complex designated DICER COMPLEX, dices the VGAM3186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3186 RNA is designated SEQ ID:72218, and is provided hereinbelow with reference to the sequence listing part.

[44567] VGAM3186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44568] VGAM3186 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3186 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3186 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44569] The complementary binding of VGAM3186 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3186 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44570] It is appreciated that VGAM3186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3186 host target genes. The mRNA of each one of this plurality of VGAM3186 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3186 RNA, herein designated VGAM RNA, and which when bound by VGAM3186 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3186 host target proteins.

[44571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3186 gene, herein designated VGAM GENE, on one or more VGAM3186 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44572] It is yet further appreciated that a function of VGAM3186 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3186 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3186 correlate with, and may be deduced from, the identity of the host target genes which VGAM3186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44573] Nucleotide sequences of the VGAM3186 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3186 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3186 are further described hereinbelow with reference to Table 1.

[44574] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3186 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44575] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3187 (VGAM3187) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44576] VGAM3187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3187 was detected is described hereinabove with reference to Figs. 2–8.

[44577] VGAM3187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44578] VGAM3187 gene, herein designated VGAM GENE, encodes a VGAM3187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3187 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3187 precursor RNA is designated SEQ ID:72222, and is provided hereinbelow with reference to the sequence listing part.

[44579] VGAM3187 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44580] An enzyme complex designated DICER COMPLEX, dices the VGAM3187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3187 RNA is designated SEQ ID:72223, and is provided hereinbelow with reference to the sequence listing part.

[44581] VGAM3187 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44582] VGAM3187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3187 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3187 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44583] The complementary binding of VGAM3187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3187 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44584] It is appreciated that VGAM3187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3187 host target genes. The mRNA of each one of this plurality of VGAM3187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3187 RNA, herein designated VGAM

RNA, and which when bound by VGAM3187 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3187 host target proteins.

[44585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3187 gene, herein designated VGAM GENE, on one or more VGAM3187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44586] It is yet further appreciated that a function of VGAM3187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3187 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3187 correlate with, and may be deduced from, the identity of the host target genes which VGAM3187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44587] Nucleotide sequences of the VGAM3187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3187 are further described hereinbelow with reference to Table 1.

[44588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44589] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3188 (VGAM3188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44590] VGAM3188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3188 was detected is described hereinabove with reference to Figs. 2-8.

[44591] VGAM3188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44592] VGAM3188 gene, herein designated VGAM GENE, encodes a VGAM3188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3188 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3188 precursor RNA is designated SEQ ID:72263, and is provided hereinbelow with reference to the sequence listing part.

[44593] VGAM3188 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44594] An enzyme complex designated DICER COMPLEX, dices the VGAM3188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3188 RNA is designated SEQ ID:72264, and is provided hereinbelow with reference to the sequence listing part.

[44595] VGAM3188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3188 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44596] VGAM3188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3188 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3188 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44597] The complementary binding of VGAM3188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3188 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44598] It is appreciated that VGAM3188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3188 host target genes. The mRNA of each one of this plurality of VGAM3188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3188 RNA, herein designated VGAM RNA, and which when bound by VGAM3188 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3188 host target proteins.

[44599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3188 gene, herein designated VGAM GENE, on one or more VGAM3188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44600] It is yet further appreciated that a function of VGAM3188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3188 include diagnosis, prevention and

treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3188 correlate with, and may be deduced from, the identity of the host target genes which VGAM3188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44601] Nucleotide sequences of the VGAM3188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3188 are further described hereinbelow with reference to Table 1.

[44602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44603] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3189 (VGAM3189) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44604] VGAM3189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3189 was detected is described hereinabove with reference to Figs. 2–8.

[44605] VGAM3189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44606] VGAM3189 gene, herein designated VGAM GENE, encodes a VGAM3189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3189 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3189 precursor RNA is designated SEQ ID:72274, and is provided hereinbelow with reference to the sequence listing part.

[44607] VGAM3189 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3189 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44608] An enzyme complex designated DICER COMPLEX, dices the VGAM3189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3189 RNA is designated SEQ ID:72275, and is provided hereinbelow with reference to the sequence listing part.

[44609] VGAM3189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3189 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3189 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44610] VGAM3189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3189 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3189 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44611] The complementary binding of VGAM3189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3189 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44612] It is appreciated that VGAM3189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3189 host target genes. The mRNA of each one of this plurality of VGAM3189 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3189 RNA, herein designated VGAM RNA, and which when bound by VGAM3189 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3189 host target proteins.

[44613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3189 gene, herein designated VGAM GENE, on one or more VGAM3189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44614] It is yet further appreciated that a function of VGAM3189 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3189 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM3189 correlate with, and may be deduced from, the identity of the host target genes which VGAM3189 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44615] Nucleotide sequences of the VGAM3189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3189 are further described hereinbelow with reference to Table 1.

[44616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44617] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3190 (VGAM3190) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[44618] VGAM3190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3190 was detected is described hereinabove with reference to Figs. 2–8.

[44619] VGAM3190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44620] VGAM3190 gene, herein designated VGAM GENE, encodes a VGAM3190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3190 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3190 precursor RNA is designated SEQ ID:72281, and is provided hereinbelow with reference to the sequence listing part.

[44621] VGAM3190 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3190 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44622] An enzyme complex designated DICER COMPLEX, dices the VGAM3190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3190 RNA is designated SEQ ID:72282, and is provided hereinbelow with reference to the sequence listing part.

[44623] VGAM3190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3190 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44624] VGAM3190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3190 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44625] The complementary binding of VGAM3190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3190 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44626] It is appreciated that VGAM3190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3190 host target genes. The mRNA of each one of this plurality of VGAM3190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3190 RNA, herein designated VGAM RNA, and which when bound by VGAM3190 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3190 host target proteins.

[44627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3190 gene, herein designated VGAM GENE, on one or more VGAM3190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44628] It is yet further appreciated that a function of VGAM3190 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3190 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3190

correlate with, and may be deduced from, the identity of the host target genes which VGAM3190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44629] Nucleotide sequences of the VGAM3190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3190 are further described hereinbelow with reference to Table 1.

[44630] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44631] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3191 (VGAM3191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[44632] VGAM3191 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3191 was detected is described hereinabove with reference to Figs. 2–8.

[44633] VGAM3191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44634] VGAM3191 gene, herein designated VGAM GENE, encodes a VGAM3191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3191 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3191 precursor RNA is designated SEQ ID:72294, and is provided hereinbelow with reference to the sequence listing part.

[44635] VGAM3191 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44636] An enzyme complex designated DICER COMPLEX, dices the VGAM3191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3191 RNA is designated SEQ ID:72295, and is provided hereinbelow with reference to the sequence listing part.

[44637] VGAM3191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44638] VGAM3191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3191 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44639] The complementary binding of VGAM3191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3191 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44640] It is appreciated that VGAM3191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3191 host target genes. The mRNA of each one of this plurality of VGAM3191 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3191 RNA, herein designated VGAM RNA, and which when bound by VGAM3191 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3191 host target proteins.

[44641] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3191 gene, herein designated VGAM GENE, on one or more VGAM3191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44642] It is yet further appreciated that a function of VGAM3191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3191 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3191 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44643] Nucleotide sequences of the VGAM3191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3191 are further described hereinbelow with reference to Table 1.

[44644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44645] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3192 (VGAM3192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44646] VGAM3192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3192 was detected is described hereinabove with reference to Figs. 2–8.

[44647] VGAM3192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Casphalia extranea densovirus. VGAM3192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44648] VGAM3192 gene, herein designated VGAM GENE, encodes a VGAM3192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3192 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3192 precursor RNA is designated SEQ ID:72319, and is provided hereinbelow with reference to the sequence listing part.

[44649] VGAM3192 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44650] An enzyme complex designated DICER COMPLEX, dices the VGAM3192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3192 RNA is designated SEQ ID:72320, and is provided hereinbelow with reference to the sequence listing part.

[44651] VGAM3192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44652] VGAM3192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3192 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44653] The complementary binding of VGAM3192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3192 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44654] It is appreciated that VGAM3192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3192 host target genes. The mRNA of each one of this plurality of VGAM3192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3192 RNA, herein designated VGAM RNA, and which when bound by VGAM3192 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3192 host target proteins.

[44655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3192 gene, herein designated VGAM GENE, on one or more VGAM3192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44656] It is yet further appreciated that a function of VGAM3192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3192 include diagnosis, prevention and treatment of viral infection by Casphalia extranea densovirus. Specific functions, and accordingly utilities, of VGAM3192 correlate with, and may be deduced from, the identity of the host target genes which VGAM3192 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44657] Nucleotide sequences of the VGAM3192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3192 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3192 are further described hereinbelow with reference to Table 1.

[44658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3192 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44659] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3193 (VGAM3193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44660] VGAM3193 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3193 was detected is described hereinabove with reference to Figs. 2–8.

[44661] VGAM3193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern cereal mosaic virus. VGAM3193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44662] VGAM3193 gene, herein designated VGAM GENE, encodes a VGAM3193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3193 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3193 precursor RNA is designated SEQ ID:72324, and is provided hereinbelow with reference to the sequence listing part.

[44663] VGAM3193 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44664] An enzyme complex designated DICER COMPLEX, dices the VGAM3193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3193 RNA is designated SEQ ID:72325, and is provided hereinbelow with reference to the sequence listing part.

[44665] VGAM3193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44666] VGAM3193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3193 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[44667] The complementary binding of VGAM3193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3193 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44668] It is appreciated that VGAM3193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3193 host target genes. The mRNA of each one of this plurality of VGAM3193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3193 RNA, herein designated VGAM RNA, and which when bound by VGAM3193 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3193 host target proteins.

[44669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3193 gene, herein designated VGAM GENE, on one or more VGAM3193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44670] It is yet further appreciated that a function of VGAM3193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3193 include diagnosis, prevention and treatment of viral infection by Northern cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM3193 correlate with, and may be deduced from, the identity of the host target genes which VGAM3193 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[44671] Nucleotide sequences of the VGAM3193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3193 are further described hereinbelow with reference to Table 1.

[44672] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44673] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3194 (VGAM3194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44674] VGAM3194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3194 was detected is described hereinabove with reference to Figs. 2–8.

[44675] VGAM3194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44676] VGAM3194 gene, herein designated VGAM GENE, encodes a VGAM3194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3194 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3194 precursor RNA is designated SEQ ID:72339, and is provided hereinbelow with reference to the sequence listing part.

[44677] VGAM3194 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44678] An enzyme complex designated DICER COMPLEX, dices the VGAM3194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3194 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3194 RNA is designated SEQ ID:72340, and is provided hereinbelow with reference to the sequence listing part.

[44679] VGAM3194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[44680] VGAM3194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3194 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44681] The complementary binding of VGAM3194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3194 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44682] It is appreciated that VGAM3194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3194 host target genes. The mRNA of each one of this plurality of VGAM3194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3194 RNA, herein designated VGAM RNA, and which when bound by VGAM3194 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3194 host target proteins.

[44683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3194 gene, herein designated VGAM GENE, on one

or more VGAM3194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44684] It is yet further appreciated that a function of VGAM3194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3194 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3194 correlate with, and may be deduced from, the identity of the host target genes which VGAM3194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44685] Nucleotide sequences of the VGAM3194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3194 are further described hereinbelow with reference to Table 1.

[44686] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44687] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3195 (VGAM3195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44688] VGAM3195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3195 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[44689] VGAM3195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44690] VGAM3195 gene, herein designated VGAM GENE, encodes a VGAM3195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3195 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3195 precursor RNA is designated SEQ ID:72361, and is provided hereinbelow with reference to the sequence listing part.

[44691] VGAM3195 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44692] An enzyme complex designated DICER COMPLEX, dices the VGAM3195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3195 RNA is designated SEQ ID:72362, and is provided hereinbelow with reference to the sequence listing part.

[44693] VGAM3195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44694] VGAM3195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3195 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44695] The complementary binding of VGAM3195 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3195 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44696] It is appreciated that VGAM3195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3195 host target genes. The mRNA of each one of this plurality of VGAM3195 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3195 RNA, herein designated VGAM RNA, and which when bound by VGAM3195 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3195 host target proteins.

[44697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3195 gene, herein designated VGAM GENE, on one or more VGAM3195 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44698] It is yet further appreciated that a function of VGAM3195 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3195 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3195 correlate with, and may be deduced from, the identity of the host target genes which VGAM3195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44699] Nucleotide sequences of the VGAM3195 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3195 are further described hereinbelow with reference to Table 1.

[44700] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44701] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3196 (VGAM3196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44702] VGAM3196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3196 was detected is described hereinabove with reference to Figs. 2-8.

[44703] VGAM3196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3196 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44704] VGAM3196 gene, herein designated VGAM GENE, encodes a VGAM3196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3196 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3196 precursor RNA is designated SEQ ID:72367, and is provided hereinbelow with reference to the sequence listing part.

[44705] VGAM3196 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[44706] An enzyme complex designated DICER COMPLEX, dices the VGAM3196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3196 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3196 RNA is designated SEQ ID:72368, and is provided hereinbelow with reference to the sequence listing part.

[44707] VGAM3196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44708] VGAM3196 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3196 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44709] The complementary binding of VGAM3196 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3196 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44710] It is appreciated that VGAM3196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3196 host target genes. The mRNA of each one of this plurality of VGAM3196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3196 RNA, herein designated VGAM RNA, and which when bound by VGAM3196 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3196 host target proteins.

[44711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3196 gene, herein designated VGAM GENE, on one or more VGAM3196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44712] It is yet further appreciated that a function of VGAM3196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3196 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3196 correlate with, and may be deduced from, the identity of the host target genes which VGAM3196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44713] Nucleotide sequences of the VGAM3196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3196 are further described hereinbelow with reference to Table 1.

[44714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44715] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3197 (VGAM3197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44716] VGAM3197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3197 was detected is described hereinabove with reference to Figs. 2-8.

[44717] VGAM3197 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Molluscum contagiosum virus. VGAM3197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44718] VGAM3197 gene, herein designated VGAM GENE, encodes a VGAM3197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3197 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3197 precursor RNA is designated SEQ ID:72371, and is provided hereinbelow with reference to the sequence listing part.

[44719] VGAM3197 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44720] An enzyme complex designated DICER COMPLEX, dices the VGAM3197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3197 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3197 RNA is designated SEQ ID:72372, and is provided hereinbelow with reference to the sequence listing part.

[44721] VGAM3197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3197 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44722] VGAM3197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3197 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44723] The complementary binding of VGAM3197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3197 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3197 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44724] It is appreciated that VGAM3197 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3197 host target genes. The mRNA of each one of this plurality of VGAM3197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3197 RNA, herein designated VGAM RNA, and which when bound by VGAM3197 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3197 host target proteins.

[44725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3197 gene, herein designated VGAM GENE, on one or more VGAM3197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44726] It is yet further appreciated that a function of VGAM3197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3197 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3197 correlate with, and may be deduced from, the identity of the host target genes which VGAM3197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44727] Nucleotide sequences of the VGAM3197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3197 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3197 are further described hereinbelow with reference to Table 1.

[44728] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44729] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3198 (VGAM3198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44730] VGAM3198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3198 was detected is described hereinabove with reference to Figs. 2-8.

[44731] VGAM3198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus

type 21. VGAM3198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44732] VGAM3198 gene, herein designated VGAM GENE, encodes a VGAM3198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3198 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3198 precursor RNA is designated SEQ ID:72399, and is provided hereinbelow with reference to the sequence listing part.

[44733] VGAM3198 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44734] An enzyme complex designated DICER COMPLEX, dices

the VGAM3198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3198 RNA is designated SEQ ID:72400, and is provided hereinbelow with reference to the sequence listing part.

[44735] VGAM3198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3198 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44736] VGAM3198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3198 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3198 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44737] The complementary binding of VGAM3198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3198 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44738] It is appreciated that VGAM3198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3198 host target genes. The mRNA of each one of this plurality of VGAM3198 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3198 RNA, herein designated VGAM RNA, and which when bound by VGAM3198 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3198 host target proteins.

[44739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3198 gene, herein designated VGAM GENE, on one or more VGAM3198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44740] It is yet further appreciated that a function of VGAM3198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3198 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 21. Specific functions, and accordingly utilities, of VGAM3198 correlate with, and may be deduced from, the identity of the host target genes which VGAM3198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44741] Nucleotide sequences of the VGAM3198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3198 are further described hereinbelow with reference to Table 1.

[44742] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44743] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3199 (VGAM3199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44744] VGAM3199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3199 was detected is described hereinabove with reference to Figs. 2-8.

[44745] VGAM3199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM3199 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[44746] VGAM3199 gene, herein designated VGAM GENE, encodes a VGAM3199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3199 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3199 precursor RNA is designated SEQ ID:72413, and is provided hereinbelow with reference to the sequence listing part.

[44747] VGAM3199 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44748] An enzyme complex designated DICER COMPLEX, dices the VGAM3199 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3199 RNA is designated SEQ ID:72414, and is provided hereinbelow with reference to the sequence listing part.

[44749] VGAM3199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3199 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44750] VGAM3199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3199 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3199 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44751] The complementary binding of VGAM3199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3199

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44752] It is appreciated that VGAM3199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3199 host target genes. The mRNA of each one of this plurality of VGAM3199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3199 RNA, herein designated VGAM RNA, and which when bound by VGAM3199 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3199 host target proteins.

[44753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3199 gene, herein designated VGAM GENE, on one or more VGAM3199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44754] It is yet further appreciated that a function of VGAM3199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3199 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3199 correlate with, and may be deduced from, the identity of the host target genes which VGAM3199 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44755] Nucleotide sequences of the VGAM3199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3199 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3199 are further described hereinbelow with reference to Table 1.

[44756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44757] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3200 (VGAM3200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44758] VGAM3200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3200 was detected is described hereinabove with reference to Figs. 2-8.

[44759] VGAM3200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[44760] VGAM3200 gene, herein designated VGAM GENE, encodes a VGAM3200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3200 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3200 precursor RNA is designated SEQ ID:72427, and is provided hereinbelow with reference to the sequence listing part.

[44761] VGAM3200 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44762] An enzyme complex designated DICER COMPLEX, dices the VGAM3200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3200 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3200 RNA is designated SEQ ID:72428, and is provided hereinbelow with reference to the sequence listing part.

[44763] VGAM3200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3200 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44764] VGAM3200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3200 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44765] The complementary binding of VGAM3200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3200 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44766] It is appreciated that VGAM3200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3200 host target genes. The mRNA of each one of this plurality of VGAM3200 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3200 RNA, herein designated VGAM RNA, and which when bound by VGAM3200 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3200 host target proteins.

[44767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3200 gene, herein designated VGAM GENE, on one or more VGAM3200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44768] It is yet further appreciated that a function of VGAM3200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3200 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3200 correlate with, and may be deduced from, the identity of the host target genes which VGAM3200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44769] Nucleotide sequences of the VGAM3200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3200 are further

described hereinbelow with reference to Table 1.

[44770] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44771] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3201 (VGAM3201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44772] VGAM3201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3201 was detected is described hereinabove with reference to Figs. 2-8.

[44773] VGAM3201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3201 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44774] VGAM3201 gene, herein designated VGAM GENE, encodes a VGAM3201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3201 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3201 precursor RNA is designated SEQ ID:72441, and is provided hereinbelow with reference to the sequence listing part.

[44775] VGAM3201 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44776] An enzyme complex designated DICER COMPLEX, dices the VGAM3201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3201 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3201 RNA is designated SEQ ID:72442, and is provided hereinbelow with reference to the sequence listing part.

[44777] VGAM3201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44778] VGAM3201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3201 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44779] The complementary binding of VGAM3201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3201 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3201 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44780] It is appreciated that VGAM3201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3201 host target genes. The mRNA of each one of this plurality of VGAM3201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3201 RNA, herein designated VGAM RNA, and which when bound by VGAM3201 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3201 host target proteins.

[44781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3201 gene, herein designated VGAM GENE, on one or more VGAM3201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44782] It is yet further appreciated that a function of VGAM3201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3201 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3201 correlate with, and may be deduced from, the identity of the host target genes which VGAM3201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44783] Nucleotide sequences of the VGAM3201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3201 are further described hereinbelow with reference to Table 1.

[44784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44785] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3202 (VGAM3202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44786] VGAM3202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3202 was detected is described hereinabove with reference to Figs. 2-8.

[44787] VGAM3202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Red clover mottle virus. VGAM3202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44788] VGAM3202 gene, herein designated VGAM GENE, encodes

a VGAM3202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3202 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3202 precursor RNA is designated SEQ ID:72450, and is provided hereinbelow with reference to the sequence listing part.

[44789] VGAM3202 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44790] An enzyme complex designated DICER COMPLEX, dices the VGAM3202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3202 RNA is designated SEQ ID:72451, and is provided hereinbelow with reference to the sequence listing part.

[44791] VGAM3202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44792] VGAM3202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3202 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44793] The complementary binding of VGAM3202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3202 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[44794] It is appreciated that VGAM3202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3202 host target genes. The mRNA of each one of this plurality of VGAM3202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3202 RNA, herein designated VGAM RNA, and which when bound by VGAM3202 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3202 host target proteins.

[44795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3202 gene, herein designated VGAM GENE, on one or more VGAM3202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44796] It is yet further appreciated that a function of VGAM3202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3202 include diagnosis, prevention and treatment of viral infection by Red clover mottle virus. Specific functions, and accordingly utilities, of VGAM3202 correlate with, and may be deduced from, the identity of the host target genes which VGAM3202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44797] Nucleotide sequences of the VGAM3202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3202 are further described hereinbelow with reference to Table 1.

[44798] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44799] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3203 (VGAM3203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44800] VGAM3203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3203 was detected is described hereinabove with reference to Figs. 2-8.

[44801] VGAM3203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44802] VGAM3203 gene, herein designated VGAM GENE, encodes a VGAM3203 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3203 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3203 precursor RNA is designated SEQ ID:72455, and is provided hereinbelow with reference to the sequence listing part.

[44803] VGAM3203 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44804] An enzyme complex designated DICER COMPLEX, dices the VGAM3203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3203 RNA is designated SEQ ID:72456, and is provided hereinbelow with reference to the sequence listing part.

[44805] VGAM3203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44806] VGAM3203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3203 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44807] The complementary binding of VGAM3203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3203 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44808] It is appreciated that VGAM3203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3203 host target genes. The mRNA of each one of this plurality of VGAM3203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3203 RNA, herein designated VGAM RNA, and which when bound by VGAM3203 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3203 host target proteins.

[44809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3203 gene, herein designated VGAM GENE, on one or more VGAM3203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44810] It is yet further appreciated that a function of VGAM3203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3203 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3203 correlate with, and may be deduced from, the identity of the host target genes which VGAM3203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44811] Nucleotide sequences of the VGAM3203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3203 are further described hereinbelow with reference to Table 1.

[44812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44813] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3204 (VGAM3204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44814] VGAM3204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3204 was detected is described hereinabove with reference to Figs. 2-8.

[44815] VGAM3204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM3204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44816] VGAM3204 gene, herein designated VGAM GENE, encodes a VGAM3204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3204 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3204 precursor RNA is designated SEQ ID:72490, and is provided hereinbelow with reference to the sequence listing part.

[44817] VGAM3204 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44818] An enzyme complex designated DICER COMPLEX, dices the VGAM3204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3204 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3204 RNA is designated SEQ ID:72491, and is provided hereinbelow with reference to the sequence listing part.

[44819] VGAM3204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44820] VGAM3204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3204 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44821] The complementary binding of VGAM3204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3204 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44822] It is appreciated that VGAM3204 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3204 host target genes. The mRNA of each one of this plurality of VGAM3204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3204 RNA, herein designated VGAM RNA, and which when bound by VGAM3204 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3204 host target proteins.

[44823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3204 gene, herein designated VGAM GENE, on one or more VGAM3204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44824] It is yet further appreciated that a function of VGAM3204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3204 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM3204 correlate with, and may be deduced from, the identity of the host target genes which VGAM3204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44825] Nucleotide sequences of the VGAM3204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3204 are further described hereinbelow with reference to Table 1.

[44826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44827] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3205 (VGAM3205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44828] VGAM3205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3205 was detected is described hereinabove with reference to Figs. 2–8.

[44829] VGAM3205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aedes albopictus densovirus. VGAM3205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44830] VGAM3205 gene, herein designated VGAM GENE, encodes a VGAM3205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3205 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3205 precursor RNA is designated SEQ ID:72494, and is provided hereinbelow with reference to the sequence listing part.

[44831] VGAM3205 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44832] An enzyme complex designated DICER COMPLEX, dices the VGAM3205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3205 RNA is designated SEQ ID:72495, and is provided hereinbelow with reference to the sequence listing part.

[44833] VGAM3205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44834] VGAM3205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3205 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44835] The complementary binding of VGAM3205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3205 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44836] It is appreciated that VGAM3205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3205 host target genes. The mRNA of each one of this plurality of VGAM3205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3205 RNA, herein designated VGAM RNA, and which when bound by VGAM3205 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3205 host target proteins.

[44837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3205 gene, herein designated VGAM GENE, on one or more VGAM3205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [44838] It is yet further appreciated that a function of VGAM3205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3205 include diagnosis, prevention and treatment of viral infection by *Aedes albopictus* denso-virus. Specific functions, and accordingly utilities, of VGAM3205 correlate with, and may be deduced from, the identity of the host target genes which VGAM3205 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [44839] Nucleotide sequences of the VGAM3205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3205 are further described hereinbelow with reference to Table 1.
- [44840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3205 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44841] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3206 (VGAM3206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44842] VGAM3206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3206 was detected is described hereinabove with reference to Figs. 2-8.

[44843] VGAM3206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44844] VGAM3206 gene, herein designated VGAM GENE, encodes a VGAM3206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3206 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3206 precursor RNA is designated SEQ ID:72500, and is provided hereinbelow with reference to the sequence listing part.

[44845] VGAM3206 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44846] An enzyme complex designated DICER COMPLEX, dices the VGAM3206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3206 RNA is designated SEQ ID:72501, and is provided hereinbelow with reference to the sequence listing part.

[44847] VGAM3206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44848] VGAM3206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3206 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44849] The complementary binding of VGAM3206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3206 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44850] It is appreciated that VGAM3206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3206 host target genes. The mRNA of

each one of this plurality of VGAM3206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3206 RNA, herein designated VGAM RNA, and which when bound by VGAM3206 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3206 host target proteins.

[44851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3206 gene, herein designated VGAM GENE, on one or more VGAM3206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[44852] It is yet further appreciated that a function of VGAM3206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3206 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3206 correlate with, and may be deduced from, the identity of the host target genes which VGAM3206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44853] Nucleotide sequences of the VGAM3206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3206 are further described hereinbelow with reference to Table 1.

[44854] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3206 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[44855] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3207 (VGAM3207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44856] VGAM3207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3207 was detected is described hereinabove with reference to Figs. 2–8.

[44857] VGAM3207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Helminthosporium victoriae virus 190S. VGAM3207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44858] VGAM3207 gene, herein designated VGAM GENE, encodes a VGAM3207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3207 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3207 precursor

sor RNA is designated SEQ ID:72510, and is provided hereinbelow with reference to the sequence listing part.

[44859] VGAM3207 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44860] An enzyme complex designated DICER COMPLEX, dices the VGAM3207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3207 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3207 RNA is designated SEQ ID:72511, and is provided hereinbelow with reference to the se-

quence listing part.

[44861] VGAM3207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44862] VGAM3207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3207 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44863] The complementary binding of VGAM3207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3207 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44864] It is appreciated that VGAM3207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3207 host target genes. The mRNA of each one of this plurality of VGAM3207 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3207 RNA, herein designated VGAM RNA, and which when bound by VGAM3207 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3207 host target proteins.

[44865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3207 gene, herein designated VGAM GENE, on one or more VGAM3207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44866] It is yet further appreciated that a function of VGAM3207

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3207 include diagnosis, prevention and treatment of viral infection by Helminthosporium victoriae virus 190S. Specific functions, and accordingly utilities, of VGAM3207 correlate with, and may be deduced from, the identity of the host target genes which VGAM3207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44867] Nucleotide sequences of the VGAM3207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3207 are further described hereinbelow with reference to Table 1.

[44868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44869] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3208 (VGAM3208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44870] VGAM3208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3208 was detected is described hereinabove with reference to Figs. 2–8.

[44871] VGAM3208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44872] VGAM3208 gene, herein designated VGAM GENE, encodes a VGAM3208 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3208 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3208 precursor RNA is designated SEQ ID:72522, and is provided

hereinbelow with reference to the sequence listing part.

[44873] VGAM3208 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44874] An enzyme complex designated DICER COMPLEX, dices the VGAM3208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3208 RNA is designated SEQ ID:72523, and is provided hereinbelow with reference to the sequence listing part.

[44875] VGAM3208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44876] VGAM3208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3208 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3208 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44877] The complementary binding of VGAM3208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3208 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44878] It is appreciated that VGAM3208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3208 host target genes. The mRNA of each one of this plurality of VGAM3208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3208 RNA, herein designated VGAM RNA, and which when bound by VGAM3208 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3208 host target proteins.

[44879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3208 gene, herein designated VGAM GENE, on one or more VGAM3208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44880] It is yet further appreciated that a function of VGAM3208 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3208 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3208 correlate with, and may be deduced from, the identity of the host target genes which VGAM3208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44881] Nucleotide sequences of the VGAM3208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3208 are further described hereinbelow with reference to Table 1.

[44882] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44883] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3209 (VGAM3209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44884] VGAM3209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3209 was detected is described hereinabove with reference to Figs. 2–8.

[44885] VGAM3209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine lentivirus. VGAM3209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44886] VGAM3209 gene, herein designated VGAM GENE, encodes a VGAM3209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3209 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3209 precursor RNA is designated SEQ ID:72528, and is provided hereinbelow with reference to the sequence listing part.

[44887] VGAM3209 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44888] An enzyme complex designated DICER COMPLEX, dices the VGAM3209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3209 RNA is designated SEQ ID:72529, and is provided hereinbelow with reference to the sequence listing part.

[44889] VGAM3209 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44890] VGAM3209 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3209 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3209 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44891] The complementary binding of VGAM3209 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3209 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44892] It is appreciated that VGAM3209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3209 host target genes. The mRNA of each one of this plurality of VGAM3209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3209 RNA, herein designated VGAM

RNA, and which when bound by VGAM3209 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3209 host target proteins.

[44893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3209 gene, herein designated VGAM GENE, on one or more VGAM3209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44894] It is yet further appreciated that a function of VGAM3209 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3209 include diagnosis, prevention and treatment of viral infection by Ovine lentivirus. Specific functions, and accordingly utilities, of VGAM3209 correlate with, and may be deduced from, the identity of the host target genes which VGAM3209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44895] Nucleotide sequences of the VGAM3209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3209 are further described hereinbelow with reference to Table 1.

[44896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44897] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3210 (VGAM3210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44898] VGAM3210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3210 was detected is described hereinabove with reference to Figs. 2-8.

[44899] VGAM3210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine lentivirus. VGAM3210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44900] VGAM3210 gene, herein designated VGAM GENE, encodes a VGAM3210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3210 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3210 precursor RNA is designated SEQ ID:72545, and is provided hereinbelow with reference to the sequence listing part.

[44901] VGAM3210 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44902] An enzyme complex designated DICER COMPLEX, dices the VGAM3210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3210 RNA is designated SEQ ID:72546, and is provided hereinbelow with reference to the sequence listing part.

[44903] VGAM3210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3210 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44904] VGAM3210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3210 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3210 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44905] The complementary binding of VGAM3210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3210 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44906] It is appreciated that VGAM3210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3210 host target genes. The mRNA of each one of this plurality of VGAM3210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3210 RNA, herein designated VGAM RNA, and which when bound by VGAM3210 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3210 host target proteins.

[44907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3210 gene, herein designated VGAM GENE, on one or more VGAM3210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44908] It is yet further appreciated that a function of VGAM3210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3210 include diagnosis, prevention and

treatment of viral infection by Ovine lentivirus. Specific functions, and accordingly utilities, of VGAM3210 correlate with, and may be deduced from, the identity of the host target genes which VGAM3210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44909] Nucleotide sequences of the VGAM3210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3210 are further described hereinbelow with reference to Table 1.

[44910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3210 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44911] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3211 (VGAM3211) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44912] VGAM3211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3211 was detected is described hereinabove with reference to Figs. 2–8.

[44913] VGAM3211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut mottle virus. VGAM3211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44914] VGAM3211 gene, herein designated VGAM GENE, encodes a VGAM3211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3211 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3211 precursor RNA is designated SEQ ID:72553, and is provided hereinbelow with reference to the sequence listing part.

[44915] VGAM3211 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3211 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44916] An enzyme complex designated DICER COMPLEX, dices the VGAM3211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3211 RNA is designated SEQ ID:72554, and is provided hereinbelow with reference to the sequence listing part.

[44917] VGAM3211 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3211 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3211 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44918] VGAM3211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3211 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3211 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44919] The complementary binding of VGAM3211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3211 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44920] It is appreciated that VGAM3211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3211 host target genes. The mRNA of each one of this plurality of VGAM3211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3211 RNA, herein designated VGAM RNA, and which when bound by VGAM3211 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3211 host target proteins.

[44921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3211 gene, herein designated VGAM GENE, on one or more VGAM3211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44922] It is yet further appreciated that a function of VGAM3211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3211 include diagnosis, prevention and treatment of viral infection by Peanut mottle virus. Specific

functions, and accordingly utilities, of VGAM3211 correlate with, and may be deduced from, the identity of the host target genes which VGAM3211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44923] Nucleotide sequences of the VGAM3211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3211 are further described hereinbelow with reference to Table 1.

[44924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44925] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3212 (VGAM3212) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[44926] VGAM3212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3212 was detected is described hereinabove with reference to Figs. 2–8.

[44927] VGAM3212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut mottle virus. VGAM3212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44928] VGAM3212 gene, herein designated VGAM GENE, encodes a VGAM3212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3212 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3212 precursor RNA is designated SEQ ID:72560, and is provided hereinbelow with reference to the sequence listing part.

[44929] VGAM3212 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3212 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44930] An enzyme complex designated DICER COMPLEX, dices the VGAM3212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3212 RNA is designated SEQ ID:72561, and is provided hereinbelow with reference to the sequence listing part.

[44931] VGAM3212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3212 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44932] VGAM3212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3212 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44933] The complementary binding of VGAM3212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3212 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44934] It is appreciated that VGAM3212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3212 host target genes. The mRNA of each one of this plurality of VGAM3212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3212 RNA, herein designated VGAM RNA, and which when bound by VGAM3212 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3212 host target proteins.

[44935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3212 gene, herein designated VGAM GENE, on one or more VGAM3212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44936] It is yet further appreciated that a function of VGAM3212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3212 include diagnosis, prevention and treatment of viral infection by Peanut mottle virus. Specific functions, and accordingly utilities, of VGAM3212 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM3212 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44937] Nucleotide sequences of the VGAM3212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3212 are further described hereinbelow with reference to Table 1.

[44938] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44939] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3213 (VGAM3213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[44940] VGAM3213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3213 was detected is described hereinabove with reference to Figs. 2–8.

[44941] VGAM3213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44942] VGAM3213 gene, herein designated VGAM GENE, encodes a VGAM3213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3213 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3213 precursor RNA is designated SEQ ID:72578, and is provided hereinbelow with reference to the sequence listing part.

[44943] VGAM3213 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44944] An enzyme complex designated DICER COMPLEX, dices the VGAM3213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3213 RNA is designated SEQ ID:72579, and is provided hereinbelow with reference to the sequence listing part.

[44945] VGAM3213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44946] VGAM3213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3213 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3213 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44947] The complementary binding of VGAM3213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3213 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44948] It is appreciated that VGAM3213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3213 host target genes. The mRNA of each one of this plurality of VGAM3213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3213 RNA, herein designated VGAM RNA, and which when bound by VGAM3213 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3213 host target proteins.

[44949] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3213 gene, herein designated VGAM GENE, on one or more VGAM3213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44950] It is yet further appreciated that a function of VGAM3213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3213 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM3213 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3213 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44951] Nucleotide sequences of the VGAM3213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3213 are further described hereinbelow with reference to Table 1.

[44952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44953] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3214 (VGAM3214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44954] VGAM3214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3214 was detected is described hereinabove with reference to Figs. 2–8.

[44955] VGAM3214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44956] VGAM3214 gene, herein designated VGAM GENE, encodes a VGAM3214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3214 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3214 precursor RNA is designated SEQ ID:72636, and is provided hereinbelow with reference to the sequence listing part.

[44957] VGAM3214 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44958] An enzyme complex designated DICER COMPLEX, dices the VGAM3214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3214 RNA is designated SEQ ID:72637, and is provided hereinbelow with reference to the sequence listing part.

[44959] VGAM3214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44960] VGAM3214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3214 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44961] The complementary binding of VGAM3214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3214 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44962] It is appreciated that VGAM3214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3214 host target genes. The mRNA of each one of this plurality of VGAM3214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3214 RNA, herein designated VGAM RNA, and which when bound by VGAM3214 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3214 host target proteins.

[44963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3214 gene, herein designated VGAM GENE, on one or more VGAM3214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44964] It is yet further appreciated that a function of VGAM3214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3214 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM3214 correlate with, and may be deduced from, the identity of the host target genes which VGAM3214 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[44965] Nucleotide sequences of the VGAM3214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3214 are further described hereinbelow with reference to Table 1.

[44966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44967] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3215 (VGAM3215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44968] VGAM3215 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3215 was detected is described hereinabove with reference to Figs. 2–8.

[44969] VGAM3215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44970] VGAM3215 gene, herein designated VGAM GENE, encodes a VGAM3215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3215 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3215 precursor RNA is designated SEQ ID:72645, and is provided hereinbelow with reference to the sequence listing part.

[44971] VGAM3215 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44972] An enzyme complex designated DICER COMPLEX, dices the VGAM3215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3215 RNA is designated SEQ ID:72646, and is provided hereinbelow with reference to the sequence listing part.

[44973] VGAM3215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[44974] VGAM3215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3215 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[44975] The complementary binding of VGAM3215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3215 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44976] It is appreciated that VGAM3215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3215 host target genes. The mRNA of each one of this plurality of VGAM3215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3215 RNA, herein designated VGAM RNA, and which when bound by VGAM3215 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3215 host target proteins.

[44977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3215 gene, herein designated VGAM GENE, on one or more VGAM3215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44978] It is yet further appreciated that a function of VGAM3215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3215 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3215 correlate with, and may be deduced from, the identity of the host target genes which VGAM3215 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[44979] Nucleotide sequences of the VGAM3215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3215 are further described hereinbelow with reference to Table 1.

[44980] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44981] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3216 (VGAM3216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44982] VGAM3216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3216 was detected is described hereinabove with reference to Figs. 2–8.

[44983] VGAM3216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44984] VGAM3216 gene, herein designated VGAM GENE, encodes a VGAM3216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3216 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3216 precursor RNA is designated SEQ ID:72685, and is provided hereinbelow with reference to the sequence listing part.

[44985] VGAM3216 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44986] An enzyme complex designated DICER COMPLEX, dices the VGAM3216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3216 RNA is designated SEQ ID:72686, and is provided hereinbelow with reference to the sequence listing part.

[44987] VGAM3216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[44988] VGAM3216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3216 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[44989] The complementary binding of VGAM3216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3216 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44990] It is appreciated that VGAM3216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3216 host target genes. The mRNA of each one of this plurality of VGAM3216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3216 RNA, herein designated VGAM RNA, and which when bound by VGAM3216 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3216 host target proteins.

[44991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3216 gene, herein designated VGAM GENE, on one

or more VGAM3216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[44992] It is yet further appreciated that a function of VGAM3216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3216 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3216 correlate with, and may be deduced from, the identity of the host target genes which VGAM3216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44993] Nucleotide sequences of the VGAM3216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3216 are further described hereinbelow with reference to Table 1.

[44994] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44995] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3217 (VGAM3217) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44996] VGAM3217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3217 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[44997] VGAM3217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44998] VGAM3217 gene, herein designated VGAM GENE, encodes a VGAM3217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3217 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3217 precursor RNA is designated SEQ ID:72688, and is provided hereinbelow with reference to the sequence listing part.

[44999] VGAM3217 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45000] An enzyme complex designated DICER COMPLEX, dices the VGAM3217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3217 RNA is designated SEQ ID:72689, and is provided hereinbelow with reference to the sequence listing part.

[45001] VGAM3217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45002] VGAM3217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3217 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45003] The complementary binding of VGAM3217 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3217 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45004] It is appreciated that VGAM3217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3217 host target genes. The mRNA of each one of this plurality of VGAM3217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3217 RNA, herein designated VGAM RNA, and which when bound by VGAM3217 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3217 host target proteins.

[45005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3217 gene, herein designated VGAM GENE, on one or more VGAM3217 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45006] It is yet further appreciated that a function of VGAM3217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3217 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3217 correlate with, and may be deduced from, the identity of the host target genes which VGAM3217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45007] Nucleotide sequences of the VGAM3217 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3217 are further described hereinbelow with reference to Table 1.

[45008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45009] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3218 (VGAM3218) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45010] VGAM3218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3218 was detected is described hereinabove with reference to Figs. 2-8.

[45011] VGAM3218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45012] VGAM3218 gene, herein designated VGAM GENE, encodes a VGAM3218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3218 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3218 precursor RNA is designated SEQ ID:72697, and is provided hereinbelow with reference to the sequence listing part.

[45013] VGAM3218 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[45014] An enzyme complex designated DICER COMPLEX, dices the VGAM3218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3218 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3218 RNA is designated SEQ ID:72698, and is provided hereinbelow with reference to the sequence listing part.

[45015] VGAM3218 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45016] VGAM3218 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3218 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45017] The complementary binding of VGAM3218 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3218 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45018] It is appreciated that VGAM3218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3218 host target genes. The mRNA of each one of this plurality of VGAM3218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3218 RNA, herein designated VGAM RNA, and which when bound by VGAM3218 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3218 host target proteins.

[45019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3218 gene, herein designated VGAM GENE, on one or more VGAM3218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45020] It is yet further appreciated that a function of VGAM3218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3218 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3218 correlate with, and may be deduced from, the identity of the host target genes which VGAM3218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45021] Nucleotide sequences of the VGAM3218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3218 are further described hereinbelow with reference to Table 1.

[45022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45023] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3219 (VGAM3219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45024] VGAM3219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3219 was detected is described hereinabove with reference to Figs. 2-8.

[45025] VGAM3219 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human papillomavirus type 47. VGAM3219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45026] VGAM3219 gene, herein designated VGAM GENE, encodes a VGAM3219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3219 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3219 precursor RNA is designated SEQ ID:72725, and is provided hereinbelow with reference to the sequence listing part.

[45027] VGAM3219 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45028] An enzyme complex designated DICER COMPLEX, dices the VGAM3219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3219 RNA is designated SEQ ID:72726, and is provided hereinbelow with reference to the sequence listing part.

[45029] VGAM3219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3219 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45030] VGAM3219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3219 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45031] The complementary binding of VGAM3219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3219 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3219 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45032] It is appreciated that VGAM3219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3219 host target genes. The mRNA of each one of this plurality of VGAM3219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3219 RNA, herein designated VGAM RNA, and which when bound by VGAM3219 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3219 host target proteins.

[45033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3219 gene, herein designated VGAM GENE, on one or more VGAM3219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45034] It is yet further appreciated that a function of VGAM3219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3219 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 47. Specific functions, and accordingly utilities, of VGAM3219 correlate with, and may be deduced from, the identity of the host target genes which VGAM3219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45035] Nucleotide sequences of the VGAM3219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3219 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3219 are further described hereinbelow with reference to Table 1.

[45036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45037] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3220 (VGAM3220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45038] VGAM3220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3220 was detected is described hereinabove with reference to Figs. 2-8.

[45039] VGAM3220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus

type 12. VGAM3220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45040] VGAM3220 gene, herein designated VGAM GENE, encodes a VGAM3220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3220 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3220 precursor RNA is designated SEQ ID:72729, and is provided hereinbelow with reference to the sequence listing part.

[45041] VGAM3220 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45042] An enzyme complex designated DICER COMPLEX, dices

the VGAM3220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3220 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3220 RNA is designated SEQ ID:72730, and is provided hereinbelow with reference to the sequence listing part.

[45043] VGAM3220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3220 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45044] VGAM3220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3220 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3220 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45045] The complementary binding of VGAM3220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3220 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45046] It is appreciated that VGAM3220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3220 host target genes. The mRNA of each one of this plurality of VGAM3220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3220 RNA, herein designated VGAM RNA, and which when bound by VGAM3220 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3220 host target proteins.

[45047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3220 gene, herein designated VGAM GENE, on one or more VGAM3220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45048] It is yet further appreciated that a function of VGAM3220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3220 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 12. Specific functions, and accordingly utilities, of VGAM3220 correlate with, and may be deduced from, the identity of the host target genes which VGAM3220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45049] Nucleotide sequences of the VGAM3220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3220 are further described hereinbelow with reference to Table 1.

[45050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45051] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3221 (VGAM3221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45052] VGAM3221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3221 was detected is described hereinabove with reference to Figs. 2-8.

[45053] VGAM3221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 13. VGAM3221 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45054] VGAM3221 gene, herein designated VGAM GENE, encodes a VGAM3221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3221 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3221 precursor RNA is designated SEQ ID:72740, and is provided hereinbelow with reference to the sequence listing part.

[45055] VGAM3221 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45056] An enzyme complex designated DICER COMPLEX, dices the VGAM3221 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3221 RNA is designated SEQ ID:72741, and is provided hereinbelow with reference to the sequence listing part.

[45057] VGAM3221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3221 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45058] VGAM3221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3221 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3221 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45059] The complementary binding of VGAM3221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3221

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45060] It is appreciated that VGAM3221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3221 host target genes. The mRNA of each one of this plurality of VGAM3221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3221 RNA, herein designated VGAM RNA, and which when bound by VGAM3221 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3221 host target proteins.

[45061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3221 gene, herein designated VGAM GENE, on one or more VGAM3221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45062] It is yet further appreciated that a function of VGAM3221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3221 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 13. Specific functions, and accordingly utilities, of VGAM3221 correlate with, and may be deduced from, the identity of the host target genes which VGAM3221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45063] Nucleotide sequences of the VGAM3221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3221 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3221 are further described hereinbelow with reference to Table 1.

[45064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3221 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45065] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3222 (VGAM3222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45066] VGAM3222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3222 was detected is described hereinabove with reference to Figs. 2-8.

[45067] VGAM3222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[45068] VGAM3222 gene, herein designated VGAM GENE, encodes a VGAM3222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3222 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3222 precursor RNA is designated SEQ ID:72762, and is provided hereinbelow with reference to the sequence listing part.

[45069] VGAM3222 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45070] An enzyme complex designated DICER COMPLEX, dices the VGAM3222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3222 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3222 RNA is designated SEQ ID:72763, and is provided hereinbelow with reference to the sequence listing part.

[45071] VGAM3222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3222 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45072] VGAM3222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3222 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45073] The complementary binding of VGAM3222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3222 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45074] It is appreciated that VGAM3222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3222 host target genes. The mRNA of each one of this plurality of VGAM3222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3222 RNA, herein designated VGAM RNA, and which when bound by VGAM3222 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3222 host target proteins.

[45075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3222 gene, herein designated VGAM GENE, on one or more VGAM3222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45076] It is yet further appreciated that a function of VGAM3222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3222 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3222 correlate with, and may be deduced from, the identity of the host target genes which VGAM3222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45077] Nucleotide sequences of the VGAM3222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3222 are further

described hereinbelow with reference to Table 1.

[45078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45079] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3223 (VGAM3223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45080] VGAM3223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3223 was detected is described hereinabove with reference to Figs. 2-8.

[45081] VGAM3223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45082] VGAM3223 gene, herein designated VGAM GENE, encodes a VGAM3223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3223 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3223 precursor RNA is designated SEQ ID:72777, and is provided hereinbelow with reference to the sequence listing part.

[45083] VGAM3223 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45084] An enzyme complex designated DICER COMPLEX, dices the VGAM3223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3223 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3223 RNA is designated SEQ ID:72778, and is provided hereinbelow with reference to the sequence listing part.

[45085] VGAM3223 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45086] VGAM3223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3223 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45087] The complementary binding of VGAM3223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3223 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3223 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45088] It is appreciated that VGAM3223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3223 host target genes. The mRNA of each one of this plurality of VGAM3223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3223 RNA, herein designated VGAM RNA, and which when bound by VGAM3223 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3223 host target proteins.

[45089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3223 gene, herein designated VGAM GENE, on one or more VGAM3223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45090] It is yet further appreciated that a function of VGAM3223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3223 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3223 correlate with, and may be deduced from, the identity of the host target genes which VGAM3223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45091] Nucleotide sequences of the VGAM3223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3223 are further described hereinbelow with reference to Table 1.

[45092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45093] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3224 (VGAM3224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45094] VGAM3224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3224 was detected is described hereinabove with reference to Figs. 2-8.

[45095] VGAM3224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 22. VGAM3224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45096] VGAM3224 gene, herein designated VGAM GENE, encodes

a VGAM3224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3224 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3224 precursor RNA is designated SEQ ID:72785, and is provided hereinbelow with reference to the sequence listing part.

[45097] VGAM3224 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45098] An enzyme complex designated DICER COMPLEX, dices the VGAM3224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3224 RNA is designated SEQ ID:72786, and is provided hereinbelow with reference to the sequence listing part.

[45099] VGAM3224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45100] VGAM3224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3224 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45101] The complementary binding of VGAM3224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3224 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[45102] It is appreciated that VGAM3224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3224 host target genes. The mRNA of each one of this plurality of VGAM3224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3224 RNA, herein designated VGAM RNA, and which when bound by VGAM3224 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3224 host target proteins.

[45103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3224 gene, herein designated VGAM GENE, on one or more VGAM3224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45104] It is yet further appreciated that a function of VGAM3224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3224 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 22. Specific functions, and accordingly utilities, of VGAM3224 correlate with, and may be deduced from, the identity of the host target genes which VGAM3224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45105] Nucleotide sequences of the VGAM3224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3224 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3224 are further described hereinbelow with reference to Table 1.

[45106] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45107] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3225 (VGAM3225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45108] VGAM3225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3225 was detected is described hereinabove with reference to Figs. 2-8.

[45109] VGAM3225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45110] VGAM3225 gene, herein designated VGAM GENE, encodes a VGAM3225 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3225 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3225 precursor RNA is designated SEQ ID:72795, and is provided hereinbelow with reference to the sequence listing part.

[45111] VGAM3225 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45112] An enzyme complex designated DICER COMPLEX, dices the VGAM3225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3225 RNA is designated SEQ ID:72796, and is provided hereinbelow with reference to the sequence listing part.

[45113] VGAM3225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45114] VGAM3225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3225 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45115] The complementary binding of VGAM3225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3225 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45116] It is appreciated that VGAM3225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3225 host target genes. The mRNA of each one of this plurality of VGAM3225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3225 RNA, herein designated VGAM RNA, and which when bound by VGAM3225 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3225 host target proteins.

[45117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3225 gene, herein designated VGAM GENE, on one or more VGAM3225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45118] It is yet further appreciated that a function of VGAM3225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3225 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3225 correlate with, and may be deduced from, the identity of the host target genes which VGAM3225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45119] Nucleotide sequences of the VGAM3225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3225 are further described hereinbelow with reference to Table 1.

[45120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45121] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3226 (VGAM3226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45122] VGAM3226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3226 was detected is described hereinabove with reference to Figs. 2-8.

[45123] VGAM3226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45124] VGAM3226 gene, herein designated VGAM GENE, encodes a VGAM3226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3226 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3226 precursor RNA is designated SEQ ID:72903, and is provided hereinbelow with reference to the sequence listing part.

[45125] VGAM3226 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45126] An enzyme complex designated DICER COMPLEX, dices the VGAM3226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3226 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3226 RNA is designated SEQ ID:72904, and is provided hereinbelow with reference to the sequence listing part.

[45127] VGAM3226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45128] VGAM3226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3226 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45129] The complementary binding of VGAM3226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3226 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45130] It is appreciated that VGAM3226 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3226 host target genes. The mRNA of each one of this plurality of VGAM3226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3226 RNA, herein designated VGAM RNA, and which when bound by VGAM3226 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3226 host target proteins.

[45131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3226 gene, herein designated VGAM GENE, on one or more VGAM3226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45132] It is yet further appreciated that a function of VGAM3226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3226 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3226 correlate with, and may be deduced from, the identity of the host target genes which VGAM3226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45133] Nucleotide sequences of the VGAM3226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3226 are further described hereinbelow with reference to Table 1.

[45134] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45135] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3227 (VGAM3227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45136] VGAM3227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3227 was detected is described hereinabove with reference to Figs. 2–8.

[45137] VGAM3227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45138] VGAM3227 gene, herein designated VGAM GENE, encodes a VGAM3227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3227 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3227 precursor RNA is designated SEQ ID:72911, and is provided hereinbelow with reference to the sequence listing part.

[45139] VGAM3227 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45140] An enzyme complex designated DICER COMPLEX, dices the VGAM3227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3227 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3227 RNA is designated SEQ ID:72912, and is provided hereinbelow with reference to the sequence listing part.

[45141] VGAM3227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45142] VGAM3227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3227 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45143] The complementary binding of VGAM3227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3227 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3227 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45144] It is appreciated that VGAM3227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3227 host target genes. The mRNA of each one of this plurality of VGAM3227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3227 RNA, herein designated VGAM RNA, and which when bound by VGAM3227 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3227 host target proteins.

[45145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3227 gene, herein designated VGAM GENE, on one or more VGAM3227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[45146] It is yet further appreciated that a function of VGAM3227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3227 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3227 correlate with, and may be deduced from, the identity of the host target genes which VGAM3227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45147] Nucleotide sequences of the VGAM3227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3227 are further described hereinbelow with reference to Table 1.

[45148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45149] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3228 (VGAM3228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45150] VGAM3228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3228 was detected is described hereinabove with reference to Figs. 2-8.

[45151] VGAM3228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45152] VGAM3228 gene, herein designated VGAM GENE, encodes a VGAM3228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3228 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3228 precursor RNA is designated SEQ ID:72920, and is provided hereinbelow with reference to the sequence listing part.

[45153] VGAM3228 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45154] An enzyme complex designated DICER COMPLEX, dices the VGAM3228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3228 RNA is designated SEQ ID:72921, and is provided hereinbelow with reference to the sequence listing part.

[45155] VGAM3228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45156] VGAM3228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3228 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45157] The complementary binding of VGAM3228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3228 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45158] It is appreciated that VGAM3228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3228 host target genes. The mRNA of

each one of this plurality of VGAM3228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3228 RNA, herein designated VGAM RNA, and which when bound by VGAM3228 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3228 host target proteins.

[45159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3228 gene, herein designated VGAM GENE, on one or more VGAM3228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[45160] It is yet further appreciated that a function of VGAM3228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3228 include diagnosis, prevention and treatment of viral infection by *Paramecium bursaria* Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3228 correlate with, and may be deduced from, the identity of the host target genes which VGAM3228 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45161] Nucleotide sequences of the VGAM3228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3228 are further described hereinbelow with reference to Table 1.

[45162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3228 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[45163] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3229 (VGAM3229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45164] VGAM3229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3229 was detected is described hereinabove with reference to Figs. 2–8.

[45165] VGAM3229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM3229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45166] VGAM3229 gene, herein designated VGAM GENE, encodes a VGAM3229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3229 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3229 precursor RNA is designated SEQ ID:72927, and is provided hereinbelow with reference to the sequence listing part.

[45167] VGAM3229 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45168] An enzyme complex designated DICER COMPLEX, dices the VGAM3229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3229 RNA is designated SEQ ID:72928,

and is provided hereinbelow with reference to the sequence listing part.

[45169] VGAM3229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45170] VGAM3229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3229 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45171] The complementary binding of VGAM3229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3229 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45172] It is appreciated that VGAM3229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3229 host target genes. The mRNA of each one of this plurality of VGAM3229 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3229 RNA, herein designated VGAM RNA, and which when bound by VGAM3229 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3229 host target proteins.

[45173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3229 gene, herein designated VGAM GENE, on one or more VGAM3229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45174] It is yet further appreciated that a function of VGAM3229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3229 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3229 correlate with, and may be deduced from, the identity of the host target genes which VGAM3229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45175] Nucleotide sequences of the VGAM3229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3229 are further described hereinbelow with reference to Table 1.

[45176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45177] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3230 (VGAM3230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45178] VGAM3230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3230 was detected is described hereinabove with reference to Figs. 2–8.

[45179] VGAM3230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 36. VGAM3230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45180] VGAM3230 gene, herein designated VGAM GENE, encodes a VGAM3230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3230 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3230 precu-

sor RNA is designated SEQ ID:72931, and is provided hereinbelow with reference to the sequence listing part.

[45181] VGAM3230 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45182] An enzyme complex designated DICER COMPLEX, dices the VGAM3230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3230 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3230 RNA is designated SEQ ID:72932, and is provided hereinbelow with reference to the se-

quence listing part.

[45183] VGAM3230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45184] VGAM3230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3230 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45185] The complementary binding of VGAM3230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3230 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45186] It is appreciated that VGAM3230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3230 host target genes. The mRNA of each one of this plurality of VGAM3230 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3230 RNA, herein designated VGAM RNA, and which when bound by VGAM3230 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3230 host target proteins.

[45187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3230 gene, herein designated VGAM GENE, on one or more VGAM3230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45188] It is yet further appreciated that a function of VGAM3230

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3230 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 36. Specific functions, and accordingly utilities, of VGAM3230 correlate with, and may be deduced from, the identity of the host target genes which VGAM3230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45189] Nucleotide sequences of the VGAM3230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3230 are further described hereinbelow with reference to Table 1.

[45190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45191] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3231 (VGAM3231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45192] VGAM3231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3231 was detected is described hereinabove with reference to Figs. 2–8.

[45193] VGAM3231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 36. VGAM3231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45194] VGAM3231 gene, herein designated VGAM GENE, encodes a VGAM3231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3231 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3231 precursor RNA is designated SEQ ID:72941, and is provided

hereinbelow with reference to the sequence listing part.

[45195] VGAM3231 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45196] An enzyme complex designated DICER COMPLEX, dices the VGAM3231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3231 RNA is designated SEQ ID:72942, and is provided hereinbelow with reference to the sequence listing part.

[45197] VGAM3231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45198] VGAM3231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3231 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3231 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45199] The complementary binding of VGAM3231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3231 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45200] It is appreciated that VGAM3231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3231 host target genes. The mRNA of each one of this plurality of VGAM3231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3231 RNA, herein designated VGAM RNA, and which when bound by VGAM3231 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3231 host target proteins.

[45201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3231 gene, herein designated VGAM GENE, on one or more VGAM3231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45202] It is yet further appreciated that a function of VGAM3231 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3231 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 36. Specific functions, and accordingly utilities, of VGAM3231 correlate with, and may be deduced from, the identity of the host target genes which VGAM3231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45203] Nucleotide sequences of the VGAM3231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3231 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3231 are further described hereinbelow with reference to Table 1.

[45204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45205] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3232 (VGAM3232) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45206] VGAM3232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3232 was detected is described hereinabove with reference to Figs. 2–8.

[45207] VGAM3232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45208] VGAM3232 gene, herein designated VGAM GENE, encodes a VGAM3232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3232 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3232 precursor RNA is designated SEQ ID:72949, and is provided hereinbelow with reference to the sequence listing part.

[45209] VGAM3232 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45210] An enzyme complex designated DICER COMPLEX, dices the VGAM3232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3232 RNA is designated SEQ ID:72950, and is provided hereinbelow with reference to the sequence listing part.

[45211] VGAM3232 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45212] VGAM3232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3232 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3232 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45213] The complementary binding of VGAM3232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3232 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45214] It is appreciated that VGAM3232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3232 host target genes. The mRNA of each one of this plurality of VGAM3232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3232 RNA, herein designated VGAM

RNA, and which when bound by VGAM3232 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3232 host target proteins.

[45215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3232 gene, herein designated VGAM GENE, on one or more VGAM3232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45216] It is yet further appreciated that a function of VGAM3232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3232 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3232 correlate with, and may be deduced from, the identity of the host target genes which VGAM3232 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45217] Nucleotide sequences of the VGAM3232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3232 are further described hereinbelow with reference to Table 1.

[45218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45219] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3233 (VGAM3233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45220] VGAM3233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3233 was detected is described hereinabove with reference to Figs. 2-8.

[45221] VGAM3233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45222] VGAM3233 gene, herein designated VGAM GENE, encodes a VGAM3233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3233 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3233 precursor RNA is designated SEQ ID:73006, and is provided hereinbelow with reference to the sequence listing part.

[45223] VGAM3233 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45224] An enzyme complex designated DICER COMPLEX, dices the VGAM3233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3233 RNA is designated SEQ ID:73007, and is provided hereinbelow with reference to the sequence listing part.

[45225] VGAM3233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3233 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45226] VGAM3233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3233 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3233 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45227] The complementary binding of VGAM3233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3233 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45228] It is appreciated that VGAM3233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3233 host target genes. The mRNA of each one of this plurality of VGAM3233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3233 RNA, herein designated VGAM RNA, and which when bound by VGAM3233 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3233 host target proteins.

[45229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3233 gene, herein designated VGAM GENE, on one or more VGAM3233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45230] It is yet further appreciated that a function of VGAM3233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3233 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3233 correlate with, and may be deduced from, the identity of the host target genes which VGAM3233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45231] Nucleotide sequences of the VGAM3233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3233 are further described hereinbelow with reference to Table 1.

[45232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45233] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3234 (VGAM3234) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45234] VGAM3234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3234 was detected is described hereinabove with reference to Figs. 2–8.

[45235] VGAM3234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cricket paralysis virus. VGAM3234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45236] VGAM3234 gene, herein designated VGAM GENE, encodes a VGAM3234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3234 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3234 precursor RNA is designated SEQ ID:73009, and is provided hereinbelow with reference to the sequence listing part.

[45237] VGAM3234 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3234 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45238] An enzyme complex designated DICER COMPLEX, dices the VGAM3234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3234 RNA is designated SEQ ID:73010, and is provided hereinbelow with reference to the sequence listing part.

[45239] VGAM3234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3234 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3234 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45240] VGAM3234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3234 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3234 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3234 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45241] The complementary binding of VGAM3234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3234 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45242] It is appreciated that VGAM3234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3234 host target genes. The mRNA of each one of this plurality of VGAM3234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3234 RNA, herein designated VGAM RNA, and which when bound by VGAM3234 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3234 host target proteins.

[45243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3234 gene, herein designated VGAM GENE, on one or more VGAM3234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45244] It is yet further appreciated that a function of VGAM3234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3234 include diagnosis, prevention and treatment of viral infection by Cricket paralysis virus. Spe-

cific functions, and accordingly utilities, of VGAM3234 correlate with, and may be deduced from, the identity of the host target genes which VGAM3234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45245] Nucleotide sequences of the VGAM3234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3234 are further described hereinbelow with reference to Table 1.

[45246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45247] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3235 (VGAM3235) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[45248] VGAM3235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3235 was detected is described hereinabove with reference to Figs. 2–8.

[45249] VGAM3235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45250] VGAM3235 gene, herein designated VGAM GENE, encodes a VGAM3235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3235 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3235 precursor RNA is designated SEQ ID:73037, and is provided hereinbelow with reference to the sequence listing part.

[45251] VGAM3235 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3235 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45252] An enzyme complex designated DICER COMPLEX, dices the VGAM3235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3235 RNA is designated SEQ ID:73038, and is provided hereinbelow with reference to the sequence listing part.

[45253] VGAM3235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3235 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45254] VGAM3235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3235 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3235 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45255] The complementary binding of VGAM3235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3235 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45256] It is appreciated that VGAM3235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3235 host target genes. The mRNA of each one of this plurality of VGAM3235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3235 RNA, herein designated VGAM RNA, and which when bound by VGAM3235 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3235 host target proteins.

[45257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3235 gene, herein designated VGAM GENE, on one or more VGAM3235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45258] It is yet further appreciated that a function of VGAM3235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3235 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of

VGAM3235 correlate with, and may be deduced from, the identity of the host target genes which VGAM3235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45259] Nucleotide sequences of the VGAM3235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3235 are further described hereinbelow with reference to Table 1.

[45260] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45261] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3236 (VGAM3236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[45262] VGAM3236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3236 was detected is described hereinabove with reference to Figs. 2–8.

[45263] VGAM3236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45264] VGAM3236 gene, herein designated VGAM GENE, encodes a VGAM3236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3236 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3236 precursor RNA is designated SEQ ID:73115, and is provided hereinbelow with reference to the sequence listing part.

[45265] VGAM3236 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45266] An enzyme complex designated DICER COMPLEX, dices the VGAM3236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3236 RNA is designated SEQ ID:73116, and is provided hereinbelow with reference to the sequence listing part.

[45267] VGAM3236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45268] VGAM3236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3236 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45269] The complementary binding of VGAM3236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3236 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45270] It is appreciated that VGAM3236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3236 host target genes. The mRNA of each one of this plurality of VGAM3236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3236 RNA, herein designated VGAM RNA, and which when bound by VGAM3236 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3236 host target proteins.

[45271] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3236 gene, herein designated VGAM GENE, on one or more VGAM3236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45272] It is yet further appreciated that a function of VGAM3236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3236 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3236 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45273] Nucleotide sequences of the VGAM3236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3236 are further described hereinbelow with reference to Table 1.

[45274] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45275] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3237 (VGAM3237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45276] VGAM3237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3237 was detected is described hereinabove with reference to Figs. 2–8.

[45277] VGAM3237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine adenovirus A. VGAM3237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45278] VGAM3237 gene, herein designated VGAM GENE, encodes a VGAM3237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3237 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3237 precursor RNA is designated SEQ ID:73131, and is provided hereinbelow with reference to the sequence listing part.

[45279] VGAM3237 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45280] An enzyme complex designated DICER COMPLEX, dices the VGAM3237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3237 RNA is designated SEQ ID:73132, and is provided hereinbelow with reference to the sequence listing part.

[45281] VGAM3237 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45282] VGAM3237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3237 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45283] The complementary binding of VGAM3237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3237 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45284] It is appreciated that VGAM3237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3237 host target genes. The mRNA of each one of this plurality of VGAM3237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3237 RNA, herein designated VGAM RNA, and which when bound by VGAM3237 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3237 host target proteins.

[45285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3237 gene, herein designated VGAM GENE, on one or more VGAM3237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45286] It is yet further appreciated that a function of VGAM3237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3237 include diagnosis, prevention and treatment of viral infection by Murine adenovirus A. Specific functions, and accordingly utilities, of VGAM3237 correlate with, and may be deduced from, the identity of the host target genes which VGAM3237 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[45287] Nucleotide sequences of the VGAM3237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3237 are further described hereinbelow with reference to Table 1.

[45288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45289] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3238 (VGAM3238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45290] VGAM3238 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3238 was detected is described hereinabove with reference to Figs. 2–8.

[45291] VGAM3238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45292] VGAM3238 gene, herein designated VGAM GENE, encodes a VGAM3238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3238 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3238 precursor RNA is designated SEQ ID:73209, and is provided hereinbelow with reference to the sequence listing part.

[45293] VGAM3238 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45294] An enzyme complex designated DICER COMPLEX, dices the VGAM3238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3238 RNA is designated SEQ ID:73210, and is provided hereinbelow with reference to the sequence listing part.

[45295] VGAM3238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45296] VGAM3238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3238 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[45297] The complementary binding of VGAM3238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3238 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45298] It is appreciated that VGAM3238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3238 host target genes. The mRNA of each one of this plurality of VGAM3238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3238 RNA, herein designated VGAM RNA, and which when bound by VGAM3238 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3238 host target proteins.

[45299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3238 gene, herein designated VGAM GENE, on one or more VGAM3238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45300] It is yet further appreciated that a function of VGAM3238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3238 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3238 correlate with, and may be deduced from, the identity of the host target genes which VGAM3238 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[45301] Nucleotide sequences of the VGAM3238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3238 are further described hereinbelow with reference to Table 1.

[45302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3238 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45303] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3239 (VGAM3239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45304] VGAM3239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3239 was detected is described hereinabove with reference to Figs. 2–8.

[45305] VGAM3239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45306] VGAM3239 gene, herein designated VGAM GENE, encodes a VGAM3239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3239 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3239 precursor RNA is designated SEQ ID:73227, and is provided hereinbelow with reference to the sequence listing part.

[45307] VGAM3239 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45308] An enzyme complex designated DICER COMPLEX, dices the VGAM3239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3239 RNA is designated SEQ ID:73228, and is provided hereinbelow with reference to the sequence listing part.

[45309] VGAM3239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[45310] VGAM3239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3239 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45311] The complementary binding of VGAM3239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3239 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45312] It is appreciated that VGAM3239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3239 host target genes. The mRNA of each one of this plurality of VGAM3239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3239 RNA, herein designated VGAM RNA, and which when bound by VGAM3239 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3239 host target proteins.

[45313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3239 gene, herein designated VGAM GENE, on one

or more VGAM3239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45314] It is yet further appreciated that a function of VGAM3239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3239 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3239 correlate with, and may be deduced from, the identity of the host target genes which VGAM3239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45315] Nucleotide sequences of the VGAM3239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3239 are further described hereinbelow with reference to Table 1.

[45316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45317] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3240 (VGAM3240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45318] VGAM3240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3240 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[45319] VGAM3240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45320] VGAM3240 gene, herein designated VGAM GENE, encodes a VGAM3240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3240 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3240 precursor RNA is designated SEQ ID:73263, and is provided hereinbelow with reference to the sequence listing part.

[45321] VGAM3240 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45322] An enzyme complex designated DICER COMPLEX, dices the VGAM3240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3240 RNA is designated SEQ ID:73264, and is provided hereinbelow with reference to the sequence listing part.

[45323] VGAM3240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45324] VGAM3240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3240 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45325] The complementary binding of VGAM3240 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3240 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45326] It is appreciated that VGAM3240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3240 host target genes. The mRNA of each one of this plurality of VGAM3240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3240 RNA, herein designated VGAM RNA, and which when bound by VGAM3240 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3240 host target proteins.

[45327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3240 gene, herein designated VGAM GENE, on one or more VGAM3240 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45328] It is yet further appreciated that a function of VGAM3240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3240 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3240 correlate with, and may be deduced from, the identity of the host target genes which VGAM3240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45329] Nucleotide sequences of the VGAM3240 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3240 are further described hereinbelow with reference to Table 1.

[45330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45331] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3241 (VGAM3241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45332] VGAM3241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3241 was detected is described hereinabove with reference to Figs. 2-8.

[45333] VGAM3241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45334] VGAM3241 gene, herein designated VGAM GENE, encodes a VGAM3241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3241 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3241 precursor RNA is designated SEQ ID:73271, and is provided hereinbelow with reference to the sequence listing part.

[45335] VGAM3241 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[45336] An enzyme complex designated DICER COMPLEX, dices the VGAM3241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3241 RNA is designated SEQ ID:73272, and is provided hereinbelow with reference to the sequence listing part.

[45337] VGAM3241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45338] VGAM3241 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3241 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45339] The complementary binding of VGAM3241 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3241 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45340] It is appreciated that VGAM3241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3241 host target genes. The mRNA of each one of this plurality of VGAM3241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3241 RNA, herein designated VGAM RNA, and which when bound by VGAM3241 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3241 host target proteins.

[45341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3241 gene, herein designated VGAM GENE, on one or more VGAM3241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45342] It is yet further appreciated that a function of VGAM3241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3241 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3241 correlate with, and may be deduced from, the identity of the host target genes which VGAM3241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45343] Nucleotide sequences of the VGAM3241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3241 are further described hereinbelow with reference to Table 1.

[45344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45345] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3242 (VGAM3242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45346] VGAM3242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3242 was detected is described hereinabove with reference to Figs. 2-8.

[45347] VGAM3242 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Transmissible gastroenteritis virus. VGAM3242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45348] VGAM3242 gene, herein designated VGAM GENE, encodes a VGAM3242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3242 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3242 precursor RNA is designated SEQ ID:73283, and is provided hereinbelow with reference to the sequence listing part.

[45349] VGAM3242 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45350] An enzyme complex designated DICER COMPLEX, dices the VGAM3242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3242 RNA is designated SEQ ID:73284, and is provided hereinbelow with reference to the sequence listing part.

[45351] VGAM3242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3242 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45352] VGAM3242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3242 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45353] The complementary binding of VGAM3242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3242 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3242 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45354] It is appreciated that VGAM3242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3242 host target genes. The mRNA of each one of this plurality of VGAM3242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3242 RNA, herein designated VGAM RNA, and which when bound by VGAM3242 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3242 host target proteins.

[45355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3242 gene, herein designated VGAM GENE, on one or more VGAM3242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45356] It is yet further appreciated that a function of VGAM3242 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3242 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM3242 correlate with, and may be deduced from, the identity of the host target genes which VGAM3242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45357] Nucleotide sequences of the VGAM3242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3242 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3242 are further described hereinbelow with reference to Table 1.

[45358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45359] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3243 (VGAM3243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45360] VGAM3243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3243 was detected is described hereinabove with reference to Figs. 2-8.

[45361] VGAM3243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45362] VGAM3243 gene, herein designated VGAM GENE, encodes a VGAM3243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3243 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3243 precursor RNA is designated SEQ ID:73302, and is provided hereinbelow with reference to the sequence listing part.

[45363] VGAM3243 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45364] An enzyme complex designated DICER COMPLEX, dices

the VGAM3243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3243 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3243 RNA is designated SEQ ID:73303, and is provided hereinbelow with reference to the sequence listing part.

[45365] VGAM3243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3243 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45366] VGAM3243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3243 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3243 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45367] The complementary binding of VGAM3243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3243 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45368] It is appreciated that VGAM3243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3243 host target genes. The mRNA of each one of this plurality of VGAM3243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3243 RNA, herein designated VGAM RNA, and which when bound by VGAM3243 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3243 host target proteins.

[45369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3243 gene, herein designated VGAM GENE, on one or more VGAM3243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45370] It is yet further appreciated that a function of VGAM3243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3243 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3243 correlate with, and may be deduced from, the identity of the host target genes which VGAM3243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45371] Nucleotide sequences of the VGAM3243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3243 are further described hereinbelow with reference to Table 1.

[45372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45373] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3244 (VGAM3244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45374] VGAM3244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3244 was detected is described hereinabove with reference to Figs. 2-8.

[45375] VGAM3244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3244 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[45376] VGAM3244 gene, herein designated VGAM GENE, encodes a VGAM3244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3244 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3244 precursor RNA is designated SEQ ID:73306, and is provided hereinbelow with reference to the sequence listing part.

[45377] VGAM3244 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45378] An enzyme complex designated DICER COMPLEX, dices the VGAM3244 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3244 RNA is designated SEQ ID:73307, and is provided hereinbelow with reference to the sequence listing part.

[45379] VGAM3244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3244 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45380] VGAM3244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3244 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3244 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45381] The complementary binding of VGAM3244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3244

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45382] It is appreciated that VGAM3244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3244 host target genes. The mRNA of each one of this plurality of VGAM3244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3244 RNA, herein designated VGAM RNA, and which when bound by VGAM3244 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3244 host target proteins.

[45383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3244 gene, herein designated VGAM GENE, on one or more VGAM3244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45384] It is yet further appreciated that a function of VGAM3244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3244 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3244 correlate with, and may be deduced from, the identity of the host target genes which VGAM3244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45385] Nucleotide sequences of the VGAM3244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3244 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3244 are further described hereinbelow with reference to Table 1.

[45386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3244 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45387] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3245 (VGAM3245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45388] VGAM3245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3245 was detected is described hereinabove with reference to Figs. 2-8.

[45389] VGAM3245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[45390] VGAM3245 gene, herein designated VGAM GENE, encodes a VGAM3245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3245 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3245 precursor RNA is designated SEQ ID:73315, and is provided hereinbelow with reference to the sequence listing part.

[45391] VGAM3245 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45392] An enzyme complex designated DICER COMPLEX, dices the VGAM3245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3245 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3245 RNA is designated SEQ ID:73316, and is provided hereinbelow with reference to the sequence listing part.

[45393] VGAM3245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3245 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45394] VGAM3245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3245 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45395] The complementary binding of VGAM3245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3245 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45396] It is appreciated that VGAM3245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3245 host target genes. The mRNA of each one of this plurality of VGAM3245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3245 RNA, herein designated VGAM RNA, and which when bound by VGAM3245 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3245 host target proteins.

[45397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3245 gene, herein designated VGAM GENE, on one or more VGAM3245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45398] It is yet further appreciated that a function of VGAM3245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3245 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3245 correlate with, and may be deduced from, the identity of the host target genes which VGAM3245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45399] Nucleotide sequences of the VGAM3245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3245 are further

described hereinbelow with reference to Table 1.

[45400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45401] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3246 (VGAM3246) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45402] VGAM3246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3246 was detected is described hereinabove with reference to Figs. 2-8.

[45403] VGAM3246 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM3246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45404] VGAM3246 gene, herein designated VGAM GENE, encodes a VGAM3246 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3246 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3246 precursor RNA is designated SEQ ID:73321, and is provided hereinbelow with reference to the sequence listing part.

[45405] VGAM3246 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45406] An enzyme complex designated DICER COMPLEX, dices the VGAM3246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3246 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3246 RNA is designated SEQ ID:73322, and is provided hereinbelow with reference to the sequence listing part.

[45407] VGAM3246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45408] VGAM3246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3246 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45409] The complementary binding of VGAM3246 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3246 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3246 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45410] It is appreciated that VGAM3246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3246 host target genes. The mRNA of each one of this plurality of VGAM3246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3246 RNA, herein designated VGAM RNA, and which when bound by VGAM3246 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3246 host target proteins.

[45411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3246 gene, herein designated VGAM GENE, on one or more VGAM3246 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45412] It is yet further appreciated that a function of VGAM3246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3246 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3246 correlate with, and may be deduced from, the identity of the host target genes which VGAM3246 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45413] Nucleotide sequences of the VGAM3246 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3246 are further described hereinbelow with reference to Table 1.

[45414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45415] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3247 (VGAM3247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45416] VGAM3247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3247 was detected is described hereinabove with reference to Figs. 2-8.

[45417] VGAM3247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM3247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45418] VGAM3247 gene, herein designated VGAM GENE, encodes

a VGAM3247 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3247 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3247 precursor RNA is designated SEQ ID:73337, and is provided hereinbelow with reference to the sequence listing part.

[45419] VGAM3247 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45420] An enzyme complex designated DICER COMPLEX, dices the VGAM3247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3247 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3247 RNA is designated SEQ ID:73338, and is provided hereinbelow with reference to the sequence listing part.

[45421] VGAM3247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45422] VGAM3247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3247 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45423] The complementary binding of VGAM3247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3247 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[45424] It is appreciated that VGAM3247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3247 host target genes. The mRNA of each one of this plurality of VGAM3247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3247 RNA, herein designated VGAM RNA, and which when bound by VGAM3247 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3247 host target proteins.

[45425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3247 gene, herein designated VGAM GENE, on one or more VGAM3247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45426] It is yet further appreciated that a function of VGAM3247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3247 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3247 correlate with, and may be deduced from, the identity of the host target genes which VGAM3247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45427] Nucleotide sequences of the VGAM3247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3247 are further described hereinbelow with reference to Table 1.

[45428] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45429] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3248 (VGAM3248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45430] VGAM3248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3248 was detected is described hereinabove with reference to Figs. 2-8.

[45431] VGAM3248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45432] VGAM3248 gene, herein designated VGAM GENE, encodes a VGAM3248 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3248 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3248 precursor RNA is designated SEQ ID:73358, and is provided hereinbelow with reference to the sequence listing part.

[45433] VGAM3248 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45434] An enzyme complex designated DICER COMPLEX, dices the VGAM3248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3248 RNA is designated SEQ ID:73359, and is provided hereinbelow with reference to the sequence listing part.

[45435] VGAM3248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45436] VGAM3248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3248 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45437] The complementary binding of VGAM3248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3248 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45438] It is appreciated that VGAM3248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3248 host target genes. The mRNA of each one of this plurality of VGAM3248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3248 RNA, herein designated VGAM RNA, and which when bound by VGAM3248 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3248 host target proteins.

[45439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3248 gene, herein designated VGAM GENE, on one or more VGAM3248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45440] It is yet further appreciated that a function of VGAM3248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3248 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3248 correlate with, and may be deduced from, the identity of the host target genes which VGAM3248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45441] Nucleotide sequences of the VGAM3248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3248 are further described hereinbelow with reference to Table 1.

[45442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45443] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3249 (VGAM3249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45444] VGAM3249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3249 was detected is described hereinabove with reference to Figs. 2-8.

[45445] VGAM3249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 90. VGAM3249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45446] VGAM3249 gene, herein designated VGAM GENE, encodes a VGAM3249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3249 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3249 precursor RNA is designated SEQ ID:73362, and is provided hereinbelow with reference to the sequence listing part.

[45447] VGAM3249 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45448] An enzyme complex designated DICER COMPLEX, dices the VGAM3249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3249 RNA is designated SEQ ID:73363, and is provided hereinbelow with reference to the sequence listing part.

[45449] VGAM3249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45450] VGAM3249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3249 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45451] The complementary binding of VGAM3249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3249 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45452] It is appreciated that VGAM3249 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3249 host target genes. The mRNA of each one of this plurality of VGAM3249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3249 RNA, herein designated VGAM RNA, and which when bound by VGAM3249 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3249 host target proteins.

[45453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3249 gene, herein designated VGAM GENE, on one or more VGAM3249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45454] It is yet further appreciated that a function of VGAM3249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3249 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 90. Specific functions, and accordingly utilities, of VGAM3249 correlate with, and may be deduced from, the identity of the host target genes which VGAM3249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45455] Nucleotide sequences of the VGAM3249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3249 are further described hereinbelow with reference to Table 1.

[45456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45457] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3250 (VGAM3250) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45458] VGAM3250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3250 was detected is described hereinabove with reference to Figs. 2–8.

[45459] VGAM3250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM3250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45460] VGAM3250 gene, herein designated VGAM GENE, encodes a VGAM3250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3250 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3250 precursor RNA is designated SEQ ID:73366, and is provided hereinbelow with reference to the sequence listing part.

[45461] VGAM3250 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45462] An enzyme complex designated DICER COMPLEX, dices the VGAM3250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3250 RNA is designated SEQ ID:73367, and is provided hereinbelow with reference to the sequence listing part.

[45463] VGAM3250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45464] VGAM3250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3250 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45465] The complementary binding of VGAM3250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3250 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45466] It is appreciated that VGAM3250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3250 host target genes. The mRNA of each one of this plurality of VGAM3250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3250 RNA, herein designated VGAM RNA, and which when bound by VGAM3250 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3250 host target proteins.

[45467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3250 gene, herein designated VGAM GENE, on one or more VGAM3250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[45468] It is yet further appreciated that a function of VGAM3250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3250 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM3250 correlate with, and may be deduced from, the identity of the host target genes which VGAM3250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45469] Nucleotide sequences of the VGAM3250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3250 are further described hereinbelow with reference to Table 1.

[45470] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45471] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3251 (VGAM3251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45472] VGAM3251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3251 was detected is described hereinabove with reference to Figs. 2–8.

[45473] VGAM3251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3251 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45474] VGAM3251 gene, herein designated VGAM GENE, encodes a VGAM3251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3251 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3251 precursor RNA is designated SEQ ID:73373, and is provided hereinbelow with reference to the sequence listing part.

[45475] VGAM3251 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45476] An enzyme complex designated DICER COMPLEX, dices the VGAM3251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3251 RNA is designated SEQ ID:73374, and is provided hereinbelow with reference to the sequence listing part.

[45477] VGAM3251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45478] VGAM3251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3251 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45479] The complementary binding of VGAM3251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3251 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45480] It is appreciated that VGAM3251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3251 host target genes. The mRNA of

each one of this plurality of VGAM3251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3251 RNA, herein designated VGAM RNA, and which when bound by VGAM3251 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3251 host target proteins.

[45481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3251 gene, herein designated VGAM GENE, on one or more VGAM3251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[45482] It is yet further appreciated that a function of VGAM3251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3251 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3251 correlate with, and may be deduced from, the identity of the host target genes which VGAM3251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45483] Nucleotide sequences of the VGAM3251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3251 are further described hereinbelow with reference to Table 1.

[45484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3251 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[45485] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3252 (VGAM3252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45486] VGAM3252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3252 was detected is described hereinabove with reference to Figs. 2–8.

[45487] VGAM3252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45488] VGAM3252 gene, herein designated VGAM GENE, encodes a VGAM3252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3252 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3252 precursor RNA is designated SEQ ID:73379, and is provided hereinbelow with reference to the sequence listing part.

[45489] VGAM3252 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45490] An enzyme complex designated DICER COMPLEX, dices the VGAM3252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3252 RNA is designated SEQ ID:73380,

and is provided hereinbelow with reference to the sequence listing part.

[45491] VGAM3252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45492] VGAM3252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3252 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45493] The complementary binding of VGAM3252 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3252 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45494] It is appreciated that VGAM3252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3252 host target genes. The mRNA of each one of this plurality of VGAM3252 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3252 RNA, herein designated VGAM RNA, and which when bound by VGAM3252 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3252 host target proteins.

[45495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3252 gene, herein designated VGAM GENE, on one or more VGAM3252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45496] It is yet further appreciated that a function of VGAM3252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3252 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3252 correlate with, and may be deduced from, the identity of the host target genes which VGAM3252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45497] Nucleotide sequences of the VGAM3252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3252 are further described hereinbelow with reference to Table 1.

[45498] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45499] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3253 (VGAM3253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45500] VGAM3253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3253 was detected is described hereinabove with reference to Figs. 2–8.

[45501] VGAM3253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV–1. VGAM3253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45502] VGAM3253 gene, herein designated VGAM GENE, encodes a VGAM3253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3253 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3253 precu-

sor RNA is designated SEQ ID:73393, and is provided hereinbelow with reference to the sequence listing part.

[45503] VGAM3253 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45504] An enzyme complex designated DICER COMPLEX, dices the VGAM3253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3253 RNA is designated SEQ ID:73394, and is provided hereinbelow with reference to the se-

quence listing part.

[45505] VGAM3253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45506] VGAM3253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3253 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45507] The complementary binding of VGAM3253 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3253 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45508] It is appreciated that VGAM3253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3253 host target genes. The mRNA of each one of this plurality of VGAM3253 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3253 RNA, herein designated VGAM RNA, and which when bound by VGAM3253 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3253 host target proteins.

[45509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3253 gene, herein designated VGAM GENE, on one or more VGAM3253 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45510] It is yet further appreciated that a function of VGAM3253

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3253 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM3253 correlate with, and may be deduced from, the identity of the host target genes which VGAM3253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45511] Nucleotide sequences of the VGAM3253 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3253 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3253 are further described hereinbelow with reference to Table 1.

[45512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45513] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3254 (VGAM3254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45514] VGAM3254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3254 was detected is described hereinabove with reference to Figs. 2–8.

[45515] VGAM3254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45516] VGAM3254 gene, herein designated VGAM GENE, encodes a VGAM3254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3254 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3254 precursor RNA is designated SEQ ID:73398, and is provided

hereinbelow with reference to the sequence listing part.

[45517] VGAM3254 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45518] An enzyme complex designated DICER COMPLEX, dices the VGAM3254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3254 RNA is designated SEQ ID:73399, and is provided hereinbelow with reference to the sequence listing part.

[45519] VGAM3254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45520] VGAM3254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3254 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3254 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45521] The complementary binding of VGAM3254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3254 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45522] It is appreciated that VGAM3254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3254 host target genes. The mRNA of each one of this plurality of VGAM3254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3254 RNA, herein designated VGAM RNA, and which when bound by VGAM3254 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3254 host target proteins.

[45523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3254 gene, herein designated VGAM GENE, on one or more VGAM3254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45524] It is yet further appreciated that a function of VGAM3254 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3254 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3254 correlate with, and may be deduced from, the identity of the host target genes which VGAM3254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45525] Nucleotide sequences of the VGAM3254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3254 are further described hereinbelow with reference to Table 1.

[45526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45527] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3255 (VGAM3255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45528] VGAM3255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3255 was detected is described hereinabove with reference to Figs. 2–8.

[45529] VGAM3255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM3255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45530] VGAM3255 gene, herein designated VGAM GENE, encodes a VGAM3255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3255 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3255 precursor RNA is designated SEQ ID:73415, and is provided hereinbelow with reference to the sequence listing part.

[45531] VGAM3255 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45532] An enzyme complex designated DICER COMPLEX, dices the VGAM3255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3255 RNA is designated SEQ ID:73416, and is provided hereinbelow with reference to the sequence listing part.

[45533] VGAM3255 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45534] VGAM3255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3255 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3255 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45535] The complementary binding of VGAM3255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3255 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45536] It is appreciated that VGAM3255 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3255 host target genes. The mRNA of each one of this plurality of VGAM3255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3255 RNA, herein designated VGAM

RNA, and which when bound by VGAM3255 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3255 host target proteins.

[45537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3255 gene, herein designated VGAM GENE, on one or more VGAM3255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45538] It is yet further appreciated that a function of VGAM3255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3255 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3255 correlate with, and may be deduced from, the identity of the host target genes which VGAM3255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45539] Nucleotide sequences of the VGAM3255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3255 are further described hereinbelow with reference to Table 1.

[45540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45541] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3256 (VGAM3256) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45542] VGAM3256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3256 was detected is described hereinabove with reference to Figs. 2–8.

[45543] VGAM3256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45544] VGAM3256 gene, herein designated VGAM GENE, encodes a VGAM3256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3256 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3256 precursor RNA is designated SEQ ID:73425, and is provided hereinbelow with reference to the sequence listing part.

[45545] VGAM3256 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45546] An enzyme complex designated DICER COMPLEX, dices the VGAM3256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3256 RNA is designated SEQ ID:73426, and is provided hereinbelow with reference to the sequence listing part.

[45547] VGAM3256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3256 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45548] VGAM3256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3256 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3256 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3256 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45549] The complementary binding of VGAM3256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3256 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45550] It is appreciated that VGAM3256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3256 host target genes. The mRNA of each one of this plurality of VGAM3256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3256 RNA, herein designated VGAM RNA, and which when bound by VGAM3256 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3256 host target proteins.

[45551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3256 gene, herein designated VGAM GENE, on one or more VGAM3256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45552] It is yet further appreciated that a function of VGAM3256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3256 include diagnosis, prevention and

treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3256 correlate with, and may be deduced from, the identity of the host target genes which VGAM3256 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45553] Nucleotide sequences of the VGAM3256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3256 are further described hereinbelow with reference to Table 1.

[45554] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45555] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3257 (VGAM3257) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45556] VGAM3257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3257 was detected is described hereinabove with reference to Figs. 2–8.

[45557] VGAM3257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45558] VGAM3257 gene, herein designated VGAM GENE, encodes a VGAM3257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3257 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3257 precursor RNA is designated SEQ ID:73428, and is provided hereinbelow with reference to the sequence listing part.

[45559] VGAM3257 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3257 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45560] An enzyme complex designated DICER COMPLEX, dices the VGAM3257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3257 RNA is designated SEQ ID:73429, and is provided hereinbelow with reference to the sequence listing part.

[45561] VGAM3257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3257 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3257 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45562] VGAM3257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3257 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3257 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3257 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45563] The complementary binding of VGAM3257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3257 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45564] It is appreciated that VGAM3257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3257 host target genes. The mRNA of each one of this plurality of VGAM3257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3257 RNA, herein designated VGAM RNA, and which when bound by VGAM3257 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3257 host target proteins.

[45565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3257 gene, herein designated VGAM GENE, on one or more VGAM3257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45566] It is yet further appreciated that a function of VGAM3257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3257 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM3257 correlate with, and may be deduced from, the identity of the host target genes which VGAM3257 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45567] Nucleotide sequences of the VGAM3257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3257 are further described hereinbelow with reference to Table 1.

[45568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45569] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3258 (VGAM3258) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[45570] VGAM3258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3258 was detected is described hereinabove with reference to Figs. 2–8.

[45571] VGAM3258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM3258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45572] VGAM3258 gene, herein designated VGAM GENE, encodes a VGAM3258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3258 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3258 precursor RNA is designated SEQ ID:73432, and is provided hereinbelow with reference to the sequence listing part.

[45573] VGAM3258 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3258 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45574] An enzyme complex designated DICER COMPLEX, dices the VGAM3258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3258 RNA is designated SEQ ID:73433, and is provided hereinbelow with reference to the sequence listing part.

[45575] VGAM3258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3258 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45576] VGAM3258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3258 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45577] The complementary binding of VGAM3258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3258 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3258 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45578] It is appreciated that VGAM3258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3258 host target genes. The mRNA of each one of this plurality of VGAM3258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3258 RNA, herein designated VGAM RNA, and which when bound by VGAM3258 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3258 host target proteins.

[45579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3258 gene, herein designated VGAM GENE, on one or more VGAM3258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45580] It is yet further appreciated that a function of VGAM3258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3258 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM3258

correlate with, and may be deduced from, the identity of the host target genes which VGAM3258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45581] Nucleotide sequences of the VGAM3258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3258 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3258 are further described hereinbelow with reference to Table 1.

[45582] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45583] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3259 (VGAM3259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[45584] VGAM3259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3259 was detected is described hereinabove with reference to Figs. 2–8.

[45585] VGAM3259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM3259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45586] VGAM3259 gene, herein designated VGAM GENE, encodes a VGAM3259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3259 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3259 precursor RNA is designated SEQ ID:73437, and is provided hereinbelow with reference to the sequence listing part.

[45587] VGAM3259 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45588] An enzyme complex designated DICER COMPLEX, dices the VGAM3259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3259 RNA is designated SEQ ID:73438, and is provided hereinbelow with reference to the sequence listing part.

[45589] VGAM3259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45590] VGAM3259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3259 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45591] The complementary binding of VGAM3259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3259 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45592] It is appreciated that VGAM3259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3259 host target genes. The mRNA of each one of this plurality of VGAM3259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3259 RNA, herein designated VGAM RNA, and which when bound by VGAM3259 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3259 host target proteins.

[45593] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3259 gene, herein designated VGAM GENE, on one or more VGAM3259 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45594] It is yet further appreciated that a function of VGAM3259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3259 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM3259 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45595] Nucleotide sequences of the VGAM3259 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3259 are further described hereinbelow with reference to Table 1.

[45596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45597] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3260 (VGAM3260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45598] VGAM3260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3260 was detected is described hereinabove with reference to Figs. 2–8.

[45599] VGAM3260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut clump virus. VGAM3260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45600] VGAM3260 gene, herein designated VGAM GENE, encodes a VGAM3260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3260 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3260 precursor RNA is designated SEQ ID:73465, and is provided hereinbelow with reference to the sequence listing part.

[45601] VGAM3260 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45602] An enzyme complex designated DICER COMPLEX, dices the VGAM3260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3260 RNA is designated SEQ ID:73466, and is provided hereinbelow with reference to the sequence listing part.

[45603] VGAM3260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45604] VGAM3260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3260 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45605] The complementary binding of VGAM3260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3260 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45606] It is appreciated that VGAM3260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3260 host target genes. The mRNA of each one of this plurality of VGAM3260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3260 RNA, herein designated VGAM RNA, and which when bound by VGAM3260 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3260 host target proteins.

[45607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3260 gene, herein designated VGAM GENE, on one or more VGAM3260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45608] It is yet further appreciated that a function of VGAM3260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3260 include diagnosis, prevention and treatment of viral infection by Peanut clump virus. Specific functions, and accordingly utilities, of VGAM3260 correlate with, and may be deduced from, the identity of the host target genes which VGAM3260 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[45609] Nucleotide sequences of the VGAM3260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3260 are further described hereinbelow with reference to Table 1.

[45610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45611] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3261 (VGAM3261) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45612] VGAM3261 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3261 was detected is described hereinabove with reference to Figs. 2–8.

[45613] VGAM3261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45614] VGAM3261 gene, herein designated VGAM GENE, encodes a VGAM3261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3261 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3261 precursor RNA is designated SEQ ID:73506, and is provided hereinbelow with reference to the sequence listing part.

[45615] VGAM3261 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45616] An enzyme complex designated DICER COMPLEX, dices the VGAM3261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3261 RNA is designated SEQ ID:73507, and is provided hereinbelow with reference to the sequence listing part.

[45617] VGAM3261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45618] VGAM3261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3261 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[45619] The complementary binding of VGAM3261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3261 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45620] It is appreciated that VGAM3261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3261 host target genes. The mRNA of each one of this plurality of VGAM3261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3261 RNA, herein designated VGAM RNA, and which when bound by VGAM3261 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3261 host target proteins.

[45621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3261 gene, herein designated VGAM GENE, on one or more VGAM3261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45622] It is yet further appreciated that a function of VGAM3261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3261 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3261 correlate with, and may be deduced from, the identity of the host target genes which VGAM3261 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[45623] Nucleotide sequences of the VGAM3261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3261 are further described hereinbelow with reference to Table 1.

[45624] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45625] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3262 (VGAM3262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45626] VGAM3262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3262 was detected is described hereinabove with reference to Figs. 2–8.

[45627] VGAM3262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome mosaic virus.

VGAM3262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45628] VGAM3262 gene, herein designated VGAM GENE, encodes a VGAM3262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3262 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3262 precursor RNA is designated SEQ ID:73511, and is provided hereinbelow with reference to the sequence listing part.

[45629] VGAM3262 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45630] An enzyme complex designated DICER COMPLEX, dices the VGAM3262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3262 RNA is designated SEQ ID:73512, and is provided hereinbelow with reference to the sequence listing part.

[45631] VGAM3262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[45632] VGAM3262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3262 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45633] The complementary binding of VGAM3262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3262 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45634] It is appreciated that VGAM3262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3262 host target genes. The mRNA of each one of this plurality of VGAM3262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3262 RNA, herein designated VGAM RNA, and which when bound by VGAM3262 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3262 host target proteins.

[45635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3262 gene, herein designated VGAM GENE, on one

or more VGAM3262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45636] It is yet further appreciated that a function of VGAM3262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3262 include diagnosis, prevention and treatment of viral infection by Brome mosaic virus. Specific functions, and accordingly utilities, of VGAM3262 correlate with, and may be deduced from, the identity of the host target genes which VGAM3262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45637] Nucleotide sequences of the VGAM3262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3262 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3262 are further described hereinbelow with reference to Table 1.

[45638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45639] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3263 (VGAM3263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45640] VGAM3263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3263 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[45641] VGAM3263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 55. VGAM3263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45642] VGAM3263 gene, herein designated VGAM GENE, encodes a VGAM3263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3263 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3263 precursor RNA is designated SEQ ID:73541, and is provided hereinbelow with reference to the sequence listing part.

[45643] VGAM3263 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45644] An enzyme complex designated DICER COMPLEX, dices the VGAM3263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3263 RNA is designated SEQ ID:73542, and is provided hereinbelow with reference to the sequence listing part.

[45645] VGAM3263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45646] VGAM3263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3263 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45647] The complementary binding of VGAM3263 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3263 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45648] It is appreciated that VGAM3263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3263 host target genes. The mRNA of each one of this plurality of VGAM3263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3263 RNA, herein designated VGAM RNA, and which when bound by VGAM3263 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3263 host target proteins.

[45649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3263 gene, herein designated VGAM GENE, on one or more VGAM3263 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45650] It is yet further appreciated that a function of VGAM3263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3263 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 55. Specific functions, and accordingly utilities, of VGAM3263 correlate with, and may be deduced from, the identity of the host target genes which VGAM3263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45651] Nucleotide sequences of the VGAM3263 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the duced VGAM3263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3263 are further described hereinbelow with reference to Table 1.

[45652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45653] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3264 (VGAM3264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45654] VGAM3264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3264 was detected is described hereinabove with reference to Figs. 2-8.

[45655] VGAM3264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 63. VGAM3264 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45656] VGAM3264 gene, herein designated VGAM GENE, encodes a VGAM3264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3264 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3264 precursor RNA is designated SEQ ID:73550, and is provided hereinbelow with reference to the sequence listing part.

[45657] VGAM3264 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[45658] An enzyme complex designated DICER COMPLEX, dices the VGAM3264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3264 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3264 RNA is designated SEQ ID:73551, and is provided hereinbelow with reference to the sequence listing part.

[45659] VGAM3264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45660] VGAM3264 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3264 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45661] The complementary binding of VGAM3264 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3264 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45662] It is appreciated that VGAM3264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3264 host target genes. The mRNA of each one of this plurality of VGAM3264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3264 RNA, herein designated VGAM RNA, and which when bound by VGAM3264 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3264 host target proteins.

[45663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3264 gene, herein designated VGAM GENE, on one or more VGAM3264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45664] It is yet further appreciated that a function of VGAM3264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3264 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 63. Specific functions, and accordingly utilities, of VGAM3264 correlate with, and may be deduced from, the identity of the host target genes which VGAM3264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45665] Nucleotide sequences of the VGAM3264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3264 are further described hereinbelow with reference to Table 1.

[45666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45667] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3265 (VGAM3265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45668] VGAM3265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3265 was detected is described hereinabove with reference to Figs. 2-8.

[45669] VGAM3265 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human papillomavirus type 63. VGAM3265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45670] VGAM3265 gene, herein designated VGAM GENE, encodes a VGAM3265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3265 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3265 precursor RNA is designated SEQ ID:73573, and is provided hereinbelow with reference to the sequence listing part.

[45671] VGAM3265 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45672] An enzyme complex designated DICER COMPLEX, dices the VGAM3265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3265 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3265 RNA is designated SEQ ID:73574, and is provided hereinbelow with reference to the sequence listing part.

[45673] VGAM3265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3265 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45674] VGAM3265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3265 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45675] The complementary binding of VGAM3265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3265 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3265 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45676] It is appreciated that VGAM3265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3265 host target genes. The mRNA of each one of this plurality of VGAM3265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3265 RNA, herein designated VGAM RNA, and which when bound by VGAM3265 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3265 host target proteins.

[45677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3265 gene, herein designated VGAM GENE, on one or more VGAM3265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45678] It is yet further appreciated that a function of VGAM3265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3265 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 63. Specific functions, and accordingly utilities, of VGAM3265 correlate with, and may be deduced from, the identity of the host target genes which VGAM3265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45679] Nucleotide sequences of the VGAM3265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3265 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3265 are further described hereinbelow with reference to Table 1.

[45680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45681] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3266 (VGAM3266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45682] VGAM3266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3266 was detected is described hereinabove with reference to Figs. 2-8.

[45683] VGAM3266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus

type 44. VGAM3266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45684] VGAM3266 gene, herein designated VGAM GENE, encodes a VGAM3266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3266 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3266 precursor RNA is designated SEQ ID:73596, and is provided hereinbelow with reference to the sequence listing part.

[45685] VGAM3266 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45686] An enzyme complex designated DICER COMPLEX, dices

the VGAM3266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3266 RNA is designated SEQ ID:73597, and is provided hereinbelow with reference to the sequence listing part.

[45687] VGAM3266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3266 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45688] VGAM3266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3266 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3266 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3266 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45689] The complementary binding of VGAM3266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3266 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45690] It is appreciated that VGAM3266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3266 host target genes. The mRNA of each one of this plurality of VGAM3266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3266 RNA, herein designated VGAM RNA, and which when bound by VGAM3266 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3266 host target proteins.

[45691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3266 gene, herein designated VGAM GENE, on one or more VGAM3266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45692] It is yet further appreciated that a function of VGAM3266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3266 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 44. Specific functions, and accordingly utilities, of VGAM3266 correlate with, and may be deduced from, the identity of the host target genes which VGAM3266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45693] Nucleotide sequences of the VGAM3266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3266 are further described hereinbelow with reference to Table 1.

[45694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45695] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3267 (VGAM3267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45696] VGAM3267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3267 was detected is described hereinabove with reference to Figs. 2-8.

[45697] VGAM3267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 60. VGAM3267 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45698] VGAM3267 gene, herein designated VGAM GENE, encodes a VGAM3267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3267 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3267 precursor RNA is designated SEQ ID:73606, and is provided hereinbelow with reference to the sequence listing part.

[45699] VGAM3267 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45700] An enzyme complex designated DICER COMPLEX, dices the VGAM3267 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3267 RNA is designated SEQ ID:73607, and is provided hereinbelow with reference to the sequence listing part.

[45701] VGAM3267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3267 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45702] VGAM3267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3267 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3267 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45703] The complementary binding of VGAM3267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3267

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45704] It is appreciated that VGAM3267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3267 host target genes. The mRNA of each one of this plurality of VGAM3267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3267 RNA, herein designated VGAM RNA, and which when bound by VGAM3267 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3267 host target proteins.

[45705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3267 gene, herein designated VGAM GENE, on one or more VGAM3267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45706] It is yet further appreciated that a function of VGAM3267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3267 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 60. Specific functions, and accordingly utilities, of VGAM3267 correlate with, and may be deduced from, the identity of the host target genes which VGAM3267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45707] Nucleotide sequences of the VGAM3267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3267 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3267 are further described hereinbelow with reference to Table 1.

[45708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45709] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3268 (VGAM3268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45710] VGAM3268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3268 was detected is described hereinabove with reference to Figs. 2-8.

[45711] VGAM3268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus type 3. VGAM3268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[45712] VGAM3268 gene, herein designated VGAM GENE, encodes a VGAM3268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3268 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3268 precursor RNA is designated SEQ ID:73612, and is provided hereinbelow with reference to the sequence listing part.

[45713] VGAM3268 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45714] An enzyme complex designated DICER COMPLEX, dices the VGAM3268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3268 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3268 RNA is designated SEQ ID:73613, and is provided hereinbelow with reference to the sequence listing part.

[45715] VGAM3268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3268 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45716] VGAM3268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3268 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45717] The complementary binding of VGAM3268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3268 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45718] It is appreciated that VGAM3268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3268 host target genes. The mRNA of each one of this plurality of VGAM3268 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3268 RNA, herein designated VGAM RNA, and which when bound by VGAM3268 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3268 host target proteins.

[45719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3268 gene, herein designated VGAM GENE, on one or more VGAM3268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45720] It is yet further appreciated that a function of VGAM3268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3268 include diagnosis, prevention and treatment of viral infection by Pestivirus type 3. Specific functions, and accordingly utilities, of VGAM3268 correlate with, and may be deduced from, the identity of the host target genes which VGAM3268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45721] Nucleotide sequences of the VGAM3268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3268 are further

described hereinbelow with reference to Table 1.

[45722] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3268 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45723] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3269 (VGAM3269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45724] VGAM3269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3269 was detected is described hereinabove with reference to Figs. 2-8.

[45725] VGAM3269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45726] VGAM3269 gene, herein designated VGAM GENE, encodes a VGAM3269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3269 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3269 precursor RNA is designated SEQ ID:73627, and is provided hereinbelow with reference to the sequence listing part.

[45727] VGAM3269 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45728] An enzyme complex designated DICER COMPLEX, dices the VGAM3269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3269 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3269 RNA is designated SEQ ID:73628, and is provided hereinbelow with reference to the sequence listing part.

[45729] VGAM3269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45730] VGAM3269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3269 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45731] The complementary binding of VGAM3269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3269 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3269 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45732] It is appreciated that VGAM3269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3269 host target genes. The mRNA of each one of this plurality of VGAM3269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3269 RNA, herein designated VGAM RNA, and which when bound by VGAM3269 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3269 host target proteins.

[45733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3269 gene, herein designated VGAM GENE, on one or more VGAM3269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45734] It is yet further appreciated that a function of VGAM3269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3269 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3269 correlate with, and may be deduced from, the identity of the host target genes which VGAM3269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45735] Nucleotide sequences of the VGAM3269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3269 are further described hereinbelow with reference to Table 1.

[45736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45737] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3270 (VGAM3270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45738] VGAM3270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3270 was detected is described hereinabove with reference to Figs. 2-8.

[45739] VGAM3270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 65. VGAM3270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45740] VGAM3270 gene, herein designated VGAM GENE, encodes

a VGAM3270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3270 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3270 precursor RNA is designated SEQ ID:73648, and is provided hereinbelow with reference to the sequence listing part.

[45741] VGAM3270 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45742] An enzyme complex designated DICER COMPLEX, dices the VGAM3270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3270 RNA is designated SEQ ID:73649, and is provided hereinbelow with reference to the sequence listing part.

[45743] VGAM3270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45744] VGAM3270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3270 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45745] The complementary binding of VGAM3270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3270 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3270 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[45746] It is appreciated that VGAM3270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3270 host target genes. The mRNA of each one of this plurality of VGAM3270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3270 RNA, herein designated VGAM RNA, and which when bound by VGAM3270 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3270 host target proteins.

[45747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3270 gene, herein designated VGAM GENE, on one or more VGAM3270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45748] It is yet further appreciated that a function of VGAM3270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3270 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 65. Specific functions, and accordingly utilities, of VGAM3270 correlate with, and may be deduced from, the identity of the host target genes which VGAM3270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45749] Nucleotide sequences of the VGAM3270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3270 are further described hereinbelow with reference to Table 1.

[45750] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45751] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3271 (VGAM3271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45752] VGAM3271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3271 was detected is described hereinabove with reference to Figs. 2-8.

[45753] VGAM3271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 25. VGAM3271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45754] VGAM3271 gene, herein designated VGAM GENE, encodes a VGAM3271 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3271 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3271 precursor RNA is designated SEQ ID:73673, and is provided hereinbelow with reference to the sequence listing part.

[45755] VGAM3271 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45756] An enzyme complex designated DICER COMPLEX, dices the VGAM3271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3271 RNA is designated SEQ ID:73674, and is provided hereinbelow with reference to the sequence listing part.

[45757] VGAM3271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45758] VGAM3271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3271 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45759] The complementary binding of VGAM3271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3271 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45760] It is appreciated that VGAM3271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3271 host target genes. The mRNA of each one of this plurality of VGAM3271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3271 RNA, herein designated VGAM RNA, and which when bound by VGAM3271 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3271 host target proteins.

[45761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3271 gene, herein designated VGAM GENE, on one or more VGAM3271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45762] It is yet further appreciated that a function of VGAM3271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3271 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 25. Specific functions, and accordingly utilities, of VGAM3271 correlate with, and may be deduced from, the identity of the host target genes which VGAM3271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45763] Nucleotide sequences of the VGAM3271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3271 are further described hereinbelow with reference to Table 1.

[45764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45765] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3272 (VGAM3272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45766] VGAM3272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3272 was detected is described hereinabove with reference to Figs. 2-8.

[45767] VGAM3272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45768] VGAM3272 gene, herein designated VGAM GENE, encodes a VGAM3272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3272 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3272 precursor RNA is designated SEQ ID:73693, and is provided hereinbelow with reference to the sequence listing part.

[45769] VGAM3272 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45770] An enzyme complex designated DICER COMPLEX, dices the VGAM3272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3272 RNA is designated SEQ ID:73694, and is provided hereinbelow with reference to the sequence listing part.

[45771] VGAM3272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45772] VGAM3272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3272 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45773] The complementary binding of VGAM3272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3272 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45774] It is appreciated that VGAM3272 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3272 host target genes. The mRNA of each one of this plurality of VGAM3272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3272 RNA, herein designated VGAM RNA, and which when bound by VGAM3272 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3272 host target proteins.

[45775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3272 gene, herein designated VGAM GENE, on one or more VGAM3272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45776] It is yet further appreciated that a function of VGAM3272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3272 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3272 correlate with, and may be deduced from, the identity of the host target genes which VGAM3272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45777] Nucleotide sequences of the VGAM3272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3272 are further described hereinbelow with reference to Table 1.

[45778] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45779] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3273 (VGAM3273) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45780] VGAM3273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3273 was detected is described hereinabove with reference to Figs. 2–8.

[45781] VGAM3273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine parvovirus. VGAM3273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45782] VGAM3273 gene, herein designated VGAM GENE, encodes a VGAM3273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3273 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3273 precursor RNA is designated SEQ ID:73713, and is provided hereinbelow with reference to the sequence listing part.

[45783] VGAM3273 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45784] An enzyme complex designated DICER COMPLEX, dices the VGAM3273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3273 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3273 RNA is designated SEQ ID:73714, and is provided hereinbelow with reference to the sequence listing part.

[45785] VGAM3273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45786] VGAM3273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3273 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45787] The complementary binding of VGAM3273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3273 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45788] It is appreciated that VGAM3273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3273 host target genes. The mRNA of each one of this plurality of VGAM3273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3273 RNA, herein designated VGAM RNA, and which when bound by VGAM3273 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3273 host target proteins.

[45789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3273 gene, herein designated VGAM GENE, on one or more VGAM3273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[45790] It is yet further appreciated that a function of VGAM3273 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3273 include diagnosis, prevention and treatment of viral infection by Canine parvovirus. Specific functions, and accordingly utilities, of VGAM3273 correlate with, and may be deduced from, the identity of the host target genes which VGAM3273 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45791] Nucleotide sequences of the VGAM3273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3273 are further described hereinbelow with reference to Table 1.

[45792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45793] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3274 (VGAM3274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45794] VGAM3274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3274 was detected is described hereinabove with reference to Figs. 2-8.

[45795] VGAM3274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3274 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45796] VGAM3274 gene, herein designated VGAM GENE, encodes a VGAM3274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3274 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3274 precursor RNA is designated SEQ ID:73718, and is provided hereinbelow with reference to the sequence listing part.

[45797] VGAM3274 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45798] An enzyme complex designated DICER COMPLEX, dices the VGAM3274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3274 RNA is designated SEQ ID:73719, and is provided hereinbelow with reference to the sequence listing part.

[45799] VGAM3274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45800] VGAM3274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3274 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45801] The complementary binding of VGAM3274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3274 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45802] It is appreciated that VGAM3274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3274 host target genes. The mRNA of

each one of this plurality of VGAM3274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3274 RNA, herein designated VGAM RNA, and which when bound by VGAM3274 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3274 host target proteins.

[45803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3274 gene, herein designated VGAM GENE, on one or more VGAM3274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[45804] It is yet further appreciated that a function of VGAM3274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3274 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3274 correlate with, and may be deduced from, the identity of the host target genes which VGAM3274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45805] Nucleotide sequences of the VGAM3274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3274 are further described hereinbelow with reference to Table 1.

[45806] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3274 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[45807] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3275 (VGAM3275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45808] VGAM3275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3275 was detected is described hereinabove with reference to Figs. 2–8.

[45809] VGAM3275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45810] VGAM3275 gene, herein designated VGAM GENE, encodes a VGAM3275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3275 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3275 precursor RNA is designated SEQ ID:73721, and is provided hereinbelow with reference to the sequence listing part.

[45811] VGAM3275 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45812] An enzyme complex designated DICER COMPLEX, dices the VGAM3275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3275 RNA is designated SEQ ID:73722,

and is provided hereinbelow with reference to the sequence listing part.

[45813] VGAM3275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45814] VGAM3275 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3275 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45815] The complementary binding of VGAM3275 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3275 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45816] It is appreciated that VGAM3275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3275 host target genes. The mRNA of each one of this plurality of VGAM3275 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3275 RNA, herein designated VGAM RNA, and which when bound by VGAM3275 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3275 host target proteins.

[45817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3275 gene, herein designated VGAM GENE, on one or more VGAM3275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45818] It is yet further appreciated that a function of VGAM3275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3275 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3275 correlate with, and may be deduced from, the identity of the host target genes which VGAM3275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45819] Nucleotide sequences of the VGAM3275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3275 are further described hereinbelow with reference to Table 1.

[45820] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45821] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3276 (VGAM3276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45822] VGAM3276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3276 was detected is described hereinabove with reference to Figs. 2–8.

[45823] VGAM3276 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45824] VGAM3276 gene, herein designated VGAM GENE, encodes a VGAM3276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3276 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3276 precu-

sor RNA is designated SEQ ID:73731, and is provided hereinbelow with reference to the sequence listing part.

[45825] VGAM3276 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45826] An enzyme complex designated DICER COMPLEX, dices the VGAM3276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3276 RNA is designated SEQ ID:73732, and is provided hereinbelow with reference to the se-

quence listing part.

[45827] VGAM3276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45828] VGAM3276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3276 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45829] The complementary binding of VGAM3276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3276 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45830] It is appreciated that VGAM3276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3276 host target genes. The mRNA of each one of this plurality of VGAM3276 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3276 RNA, herein designated VGAM RNA, and which when bound by VGAM3276 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3276 host target proteins.

[45831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3276 gene, herein designated VGAM GENE, on one or more VGAM3276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45832] It is yet further appreciated that a function of VGAM3276

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3276 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3276 correlate with, and may be deduced from, the identity of the host target genes which VGAM3276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45833] Nucleotide sequences of the VGAM3276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3276 are further described hereinbelow with reference to Table 1.

[45834] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45835] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3277 (VGAM3277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45836] VGAM3277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3277 was detected is described hereinabove with reference to Figs. 2–8.

[45837] VGAM3277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45838] VGAM3277 gene, herein designated VGAM GENE, encodes a VGAM3277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3277 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3277 precursor RNA is designated SEQ ID:73740, and is provided

hereinbelow with reference to the sequence listing part.

[45839] VGAM3277 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45840] An enzyme complex designated DICER COMPLEX, dices the VGAM3277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3277 RNA is designated SEQ ID:73741, and is provided hereinbelow with reference to the sequence listing part.

[45841] VGAM3277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45842] VGAM3277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3277 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3277 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45843] The complementary binding of VGAM3277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3277 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45844] It is appreciated that VGAM3277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3277 host target genes. The mRNA of each one of this plurality of VGAM3277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3277 RNA, herein designated VGAM RNA, and which when bound by VGAM3277 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3277 host target proteins.

[45845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3277 gene, herein designated VGAM GENE, on one or more VGAM3277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45846] It is yet further appreciated that a function of VGAM3277 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3277 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3277 correlate with, and may be deduced from, the identity of the host target genes which VGAM3277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45847] Nucleotide sequences of the VGAM3277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3277 are further described hereinbelow with reference to Table 1.

[45848] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45849] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3278 (VGAM3278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45850] VGAM3278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3278 was detected is described hereinabove with reference to Figs. 2–8.

[45851] VGAM3278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM3278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45852] VGAM3278 gene, herein designated VGAM GENE, encodes a VGAM3278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3278 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3278 precursor RNA is designated SEQ ID:73789, and is provided hereinbelow with reference to the sequence listing part.

[45853] VGAM3278 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45854] An enzyme complex designated DICER COMPLEX, dices the VGAM3278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3278 RNA is designated SEQ ID:73790, and is provided hereinbelow with reference to the sequence listing part.

[45855] VGAM3278 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45856] VGAM3278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3278 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3278 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45857] The complementary binding of VGAM3278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3278 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45858] It is appreciated that VGAM3278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3278 host target genes. The mRNA of each one of this plurality of VGAM3278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3278 RNA, herein designated VGAM

RNA, and which when bound by VGAM3278 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3278 host target proteins.

[45859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3278 gene, herein designated VGAM GENE, on one or more VGAM3278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45860] It is yet further appreciated that a function of VGAM3278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3278 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM3278 correlate with, and may be deduced from, the identity of the host target genes which VGAM3278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45861] Nucleotide sequences of the VGAM3278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3278 are further described hereinbelow with reference to Table 1.

[45862] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45863] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3279 (VGAM3279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45864] VGAM3279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3279 was detected is described hereinabove with reference to Figs. 2-8.

[45865] VGAM3279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM3279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45866] VGAM3279 gene, herein designated VGAM GENE, encodes a VGAM3279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3279 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3279 precursor RNA is designated SEQ ID:73799, and is provided hereinbelow with reference to the sequence listing part.

[45867] VGAM3279 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45868] An enzyme complex designated DICER COMPLEX, dices the VGAM3279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3279 RNA is designated SEQ ID:73800, and is provided hereinbelow with reference to the sequence listing part.

[45869] VGAM3279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3279 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45870] VGAM3279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3279 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3279 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45871] The complementary binding of VGAM3279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3279 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45872] It is appreciated that VGAM3279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3279 host target genes. The mRNA of each one of this plurality of VGAM3279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3279 RNA, herein designated VGAM RNA, and which when bound by VGAM3279 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3279 host target proteins.

[45873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3279 gene, herein designated VGAM GENE, on one or more VGAM3279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45874] It is yet further appreciated that a function of VGAM3279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3279 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM3279 correlate with, and may be deduced from, the identity of the host target genes which VGAM3279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45875] Nucleotide sequences of the VGAM3279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3279 are further described hereinbelow with reference to Table 1.

[45876] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45877] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3280 (VGAM3280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45878] VGAM3280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3280 was detected is described hereinabove with reference to Figs. 2–8.

[45879] VGAM3280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45880] VGAM3280 gene, herein designated VGAM GENE, encodes a VGAM3280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3280 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3280 precu-

sor RNA is designated SEQ ID:73815, and is provided hereinbelow with reference to the sequence listing part.

[45881] VGAM3280 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45882] An enzyme complex designated DICER COMPLEX, dices the VGAM3280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3280 RNA is designated SEQ ID:73816, and is provided hereinbelow with reference to the se-

quence listing part.

[45883] VGAM3280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45884] VGAM3280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3280 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45885] The complementary binding of VGAM3280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3280 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45886] It is appreciated that VGAM3280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3280 host target genes. The mRNA of each one of this plurality of VGAM3280 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3280 RNA, herein designated VGAM RNA, and which when bound by VGAM3280 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3280 host target proteins.

[45887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3280 gene, herein designated VGAM GENE, on one or more VGAM3280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45888] It is yet further appreciated that a function of VGAM3280

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3280 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3280 correlate with, and may be deduced from, the identity of the host target genes which VGAM3280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45889] Nucleotide sequences of the VGAM3280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3280 are further described hereinbelow with reference to Table 1.

[45890] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45891] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3281 (VGAM3281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45892] VGAM3281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3281 was detected is described hereinabove with reference to Figs. 2–8.

[45893] VGAM3281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 15. VGAM3281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45894] VGAM3281 gene, herein designated VGAM GENE, encodes a VGAM3281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3281 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3281 precursor RNA is designated SEQ ID:73823, and is provided

hereinbelow with reference to the sequence listing part.

[45895] VGAM3281 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45896] An enzyme complex designated DICER COMPLEX, dices the VGAM3281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3281 RNA is designated SEQ ID:73824, and is provided hereinbelow with reference to the sequence listing part.

[45897] VGAM3281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45898] VGAM3281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3281 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3281 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45899] The complementary binding of VGAM3281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3281 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45900] It is appreciated that VGAM3281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3281 host target genes. The mRNA of each one of this plurality of VGAM3281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3281 RNA, herein designated VGAM RNA, and which when bound by VGAM3281 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3281 host target proteins.

[45901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3281 gene, herein designated VGAM GENE, on one or more VGAM3281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45902] It is yet further appreciated that a function of VGAM3281 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3281 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 15. Specific functions, and accordingly utilities, of VGAM3281 correlate with, and may be deduced from, the identity of the host target genes which VGAM3281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45903] Nucleotide sequences of the VGAM3281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3281 are further described hereinbelow with reference to Table 1.

[45904] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45905] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3282 (VGAM3282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45906] VGAM3282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3282 was detected is described hereinabove with reference to Figs. 2–8.

[45907] VGAM3282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 9. VGAM3282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45908] VGAM3282 gene, herein designated VGAM GENE, encodes a VGAM3282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3282 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3282 precursor RNA is designated SEQ ID:73828, and is provided hereinbelow with reference to the sequence listing part.

[45909] VGAM3282 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45910] An enzyme complex designated DICER COMPLEX, dices the VGAM3282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3282 RNA is designated SEQ ID:73829, and is provided hereinbelow with reference to the sequence listing part.

[45911] VGAM3282 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45912] VGAM3282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3282 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3282 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45913] The complementary binding of VGAM3282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3282 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45914] It is appreciated that VGAM3282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3282 host target genes. The mRNA of each one of this plurality of VGAM3282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3282 RNA, herein designated VGAM

RNA, and which when bound by VGAM3282 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3282 host target proteins.

[45915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3282 gene, herein designated VGAM GENE, on one or more VGAM3282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45916] It is yet further appreciated that a function of VGAM3282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3282 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 9. Specific functions, and accordingly utilities, of VGAM3282 correlate with, and may be deduced from, the identity of the host target genes which VGAM3282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45917] Nucleotide sequences of the VGAM3282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3282 are further described hereinbelow with reference to Table 1.

[45918] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45919] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3283 (VGAM3283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45920] VGAM3283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3283 was detected is described hereinabove with reference to Figs. 2-8.

[45921] VGAM3283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45922] VGAM3283 gene, herein designated VGAM GENE, encodes a VGAM3283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3283 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3283 precursor RNA is designated SEQ ID:73839, and is provided hereinbelow with reference to the sequence listing part.

[45923] VGAM3283 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45924] An enzyme complex designated DICER COMPLEX, dices the VGAM3283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3283 RNA is designated SEQ ID:73840, and is provided hereinbelow with reference to the sequence listing part.

[45925] VGAM3283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3283 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45926] VGAM3283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3283 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3283 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45927] The complementary binding of VGAM3283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3283 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45928] It is appreciated that VGAM3283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3283 host target genes. The mRNA of each one of this plurality of VGAM3283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3283 RNA, herein designated VGAM RNA, and which when bound by VGAM3283 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3283 host target proteins.

[45929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3283 gene, herein designated VGAM GENE, on one or more VGAM3283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45930] It is yet further appreciated that a function of VGAM3283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3283 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3283 correlate with, and may be deduced from, the identity of the host target genes which VGAM3283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45931] Nucleotide sequences of the VGAM3283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3283 are further described hereinbelow with reference to Table 1.

[45932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45933] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3284 (VGAM3284) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45934] VGAM3284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3284 was detected is described hereinabove with reference to Figs. 2–8.

[45935] VGAM3284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45936] VGAM3284 gene, herein designated VGAM GENE, encodes a VGAM3284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3284 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3284 precursor RNA is designated SEQ ID:73844, and is provided hereinbelow with reference to the sequence listing part.

[45937] VGAM3284 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3284 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45938] An enzyme complex designated DICER COMPLEX, dices the VGAM3284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3284 RNA is designated SEQ ID:73845, and is provided hereinbelow with reference to the sequence listing part.

[45939] VGAM3284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3284 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3284 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45940] VGAM3284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3284 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3284 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3284 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45941] The complementary binding of VGAM3284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3284 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45942] It is appreciated that VGAM3284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3284 host target genes. The mRNA of each one of this plurality of VGAM3284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3284 RNA, herein designated VGAM RNA, and which when bound by VGAM3284 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3284 host target proteins.

[45943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3284 gene, herein designated VGAM GENE, on one or more VGAM3284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45944] It is yet further appreciated that a function of VGAM3284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3284 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM3284 correlate with, and may be deduced from, the identity of the host target genes which VGAM3284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45945] Nucleotide sequences of the VGAM3284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3284 are further described hereinbelow with reference to Table 1.

[45946] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45947] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3285 (VGAM3285) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[45948] VGAM3285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3285 was detected is described hereinabove with reference to Figs. 2–8.

[45949] VGAM3285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45950] VGAM3285 gene, herein designated VGAM GENE, encodes a VGAM3285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3285 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3285 precursor RNA is designated SEQ ID:73875, and is provided hereinbelow with reference to the sequence listing part.

[45951] VGAM3285 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3285 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45952] An enzyme complex designated DICER COMPLEX, dices the VGAM3285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3285 RNA is designated SEQ ID:73876, and is provided hereinbelow with reference to the sequence listing part.

[45953] VGAM3285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3285 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45954] VGAM3285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3285 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45955] The complementary binding of VGAM3285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3285 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45956] It is appreciated that VGAM3285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3285 host target genes. The mRNA of each one of this plurality of VGAM3285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3285 RNA, herein designated VGAM RNA, and which when bound by VGAM3285 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3285 host target proteins.

[45957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3285 gene, herein designated VGAM GENE, on one or more VGAM3285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45958] It is yet further appreciated that a function of VGAM3285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3285 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3285 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM3285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45959] Nucleotide sequences of the VGAM3285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3285 are further described hereinbelow with reference to Table 1.

[45960] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45961] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3286 (VGAM3286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[45962] VGAM3286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3286 was detected is described hereinabove with reference to Figs. 2–8.

[45963] VGAM3286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45964] VGAM3286 gene, herein designated VGAM GENE, encodes a VGAM3286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3286 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3286 precursor RNA is designated SEQ ID:73886, and is provided hereinbelow with reference to the sequence listing part.

[45965] VGAM3286 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45966] An enzyme complex designated DICER COMPLEX, dices the VGAM3286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3286 RNA is designated SEQ ID:73887, and is provided hereinbelow with reference to the sequence listing part.

[45967] VGAM3286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45968] VGAM3286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3286 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45969] The complementary binding of VGAM3286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3286 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45970] It is appreciated that VGAM3286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3286 host target genes. The mRNA of each one of this plurality of VGAM3286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3286 RNA, herein designated VGAM RNA, and which when bound by VGAM3286 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3286 host target proteins.

[45971] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3286 gene, herein designated VGAM GENE, on one or more VGAM3286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45972] It is yet further appreciated that a function of VGAM3286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3286 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3286 correlate with, and may be deduced

from, the identity of the host target genes which VGAM3286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45973] Nucleotide sequences of the VGAM3286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3286 are further described hereinbelow with reference to Table 1.

[45974] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45975] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3287 (VGAM3287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45976] VGAM3287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3287 was detected is described hereinabove with reference to Figs. 2–8.

[45977] VGAM3287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM3287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45978] VGAM3287 gene, herein designated VGAM GENE, encodes a VGAM3287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3287 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3287 precursor RNA is designated SEQ ID:73893, and is provided hereinbelow with reference to the sequence listing part.

[45979] VGAM3287 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45980] An enzyme complex designated DICER COMPLEX, dices the VGAM3287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3287 RNA is designated SEQ ID:73894, and is provided hereinbelow with reference to the sequence listing part.

[45981] VGAM3287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45982] VGAM3287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3287 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[45983] The complementary binding of VGAM3287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3287 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45984] It is appreciated that VGAM3287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3287 host target genes. The mRNA of each one of this plurality of VGAM3287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3287 RNA, herein designated VGAM RNA, and which when bound by VGAM3287 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3287 host target proteins.

[45985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3287 gene, herein designated VGAM GENE, on one or more VGAM3287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[45986] It is yet further appreciated that a function of VGAM3287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3287 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3287 correlate with, and may be deduced from, the identity of the host target genes which VGAM3287 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[45987] Nucleotide sequences of the VGAM3287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3287 are further described hereinbelow with reference to Table 1.

[45988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45989] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3288 (VGAM3288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45990] VGAM3288 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3288 was detected is described hereinabove with reference to Figs. 2–8.

[45991] VGAM3288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45992] VGAM3288 gene, herein designated VGAM GENE, encodes a VGAM3288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3288 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3288 precursor RNA is designated SEQ ID:73897, and is provided hereinbelow with reference to the sequence listing part.

[45993] VGAM3288 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45994] An enzyme complex designated DICER COMPLEX, dices the VGAM3288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3288 RNA is designated SEQ ID:73898, and is provided hereinbelow with reference to the sequence listing part.

[45995] VGAM3288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[45996] VGAM3288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3288 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[45997] The complementary binding of VGAM3288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3288 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45998] It is appreciated that VGAM3288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3288 host target genes. The mRNA of each one of this plurality of VGAM3288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3288 RNA, herein designated VGAM RNA, and which when bound by VGAM3288 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3288 host target proteins.

[45999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3288 gene, herein designated VGAM GENE, on one or more VGAM3288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46000] It is yet further appreciated that a function of VGAM3288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3288 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3288 correlate with, and may be deduced from, the identity of the host target genes which VGAM3288 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[46001] Nucleotide sequences of the VGAM3288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3288 are further described hereinbelow with reference to Table 1.

[46002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46003] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3289 (VGAM3289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46004] VGAM3289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3289 was detected is described hereinabove with reference to Figs. 2–8.

[46005] VGAM3289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46006] VGAM3289 gene, herein designated VGAM GENE, encodes a VGAM3289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3289 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3289 precursor RNA is designated SEQ ID:73902, and is provided hereinbelow with reference to the sequence listing part.

[46007] VGAM3289 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46008] An enzyme complex designated DICER COMPLEX, dices the VGAM3289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3289 RNA is designated SEQ ID:73903, and is provided hereinbelow with reference to the sequence listing part.

[46009] VGAM3289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[46010] VGAM3289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3289 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46011] The complementary binding of VGAM3289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3289 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46012] It is appreciated that VGAM3289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3289 host target genes. The mRNA of each one of this plurality of VGAM3289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3289 RNA, herein designated VGAM RNA, and which when bound by VGAM3289 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3289 host target proteins.

[46013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3289 gene, herein designated VGAM GENE, on one

or more VGAM3289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46014] It is yet further appreciated that a function of VGAM3289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3289 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3289 correlate with, and may be deduced from, the identity of the host target genes which VGAM3289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46015] Nucleotide sequences of the VGAM3289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3289 are further described hereinbelow with reference to Table 1.

[46016] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46017] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3290 (VGAM3290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46018] VGAM3290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3290 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[46019] VGAM3290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 89. VGAM3290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46020] VGAM3290 gene, herein designated VGAM GENE, encodes a VGAM3290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3290 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3290 precursor RNA is designated SEQ ID:73956, and is provided hereinbelow with reference to the sequence listing part.

[46021] VGAM3290 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46022] An enzyme complex designated DICER COMPLEX, dices the VGAM3290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3290 RNA is designated SEQ ID:73957, and is provided hereinbelow with reference to the sequence listing part.

[46023] VGAM3290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46024] VGAM3290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3290 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46025] The complementary binding of VGAM3290 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3290 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46026] It is appreciated that VGAM3290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3290 host target genes. The mRNA of each one of this plurality of VGAM3290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3290 RNA, herein designated VGAM RNA, and which when bound by VGAM3290 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3290 host target proteins.

[46027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3290 gene, herein designated VGAM GENE, on one or more VGAM3290 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46028] It is yet further appreciated that a function of VGAM3290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3290 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 89. Specific functions, and accordingly utilities, of VGAM3290 correlate with, and may be deduced from, the identity of the host target genes which VGAM3290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46029] Nucleotide sequences of the VGAM3290 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3290 are further described hereinbelow with reference to Table 1.

[46030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46031] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3291 (VGAM3291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46032] VGAM3291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3291 was detected is described hereinabove with reference to Figs. 2-8.

[46033] VGAM3291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 84. VGAM3291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46034] VGAM3291 gene, herein designated VGAM GENE, encodes a VGAM3291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3291 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3291 precursor RNA is designated SEQ ID:73998, and is provided hereinbelow with reference to the sequence listing part.

[46035] VGAM3291 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[46036] An enzyme complex designated DICER COMPLEX, dices the VGAM3291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3291 RNA is designated SEQ ID:73999, and is provided hereinbelow with reference to the sequence listing part.

[46037] VGAM3291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46038] VGAM3291 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3291 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46039] The complementary binding of VGAM3291 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3291 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46040] It is appreciated that VGAM3291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3291 host target genes. The mRNA of each one of this plurality of VGAM3291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3291 RNA, herein designated VGAM RNA, and which when bound by VGAM3291 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3291 host target proteins.

[46041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3291 gene, herein designated VGAM GENE, on one or more VGAM3291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46042] It is yet further appreciated that a function of VGAM3291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3291 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 84. Specific functions, and accordingly utilities, of VGAM3291 correlate with, and may be deduced from, the identity of the host target genes which VGAM3291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46043] Nucleotide sequences of the VGAM3291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3291 are further described hereinbelow with reference to Table 1.

[46044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46045] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3292 (VGAM3292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46046] VGAM3292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3292 was detected is described hereinabove with reference to Figs. 2-8.

[46047] VGAM3292 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 5. VGAM3292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46048] VGAM3292 gene, herein designated VGAM GENE, encodes a VGAM3292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3292 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3292 precursor RNA is designated SEQ ID:74030, and is provided hereinbelow with reference to the sequence listing part.

[46049] VGAM3292 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46050] An enzyme complex designated DICER COMPLEX, dices the VGAM3292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3292 RNA is designated SEQ ID:74031, and is provided hereinbelow with reference to the sequence listing part.

[46051] VGAM3292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3292 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46052] VGAM3292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3292 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46053] The complementary binding of VGAM3292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3292 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3292 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46054] It is appreciated that VGAM3292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3292 host target genes. The mRNA of each one of this plurality of VGAM3292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3292 RNA, herein designated VGAM RNA, and which when bound by VGAM3292 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3292 host target proteins.

[46055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3292 gene, herein designated VGAM GENE, on one or more VGAM3292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46056] It is yet further appreciated that a function of VGAM3292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3292 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3292 correlate with, and may be deduced from, the identity of the host target genes which VGAM3292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46057] Nucleotide sequences of the VGAM3292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3292 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3292 are further described hereinbelow with reference to Table 1.

[46058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46059] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3293 (VGAM3293) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46060] VGAM3293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3293 was detected is described hereinabove with reference to Figs. 2-8.

[46061] VGAM3293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Broad bean mottle virus.

VGAM3293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46062] VGAM3293 gene, herein designated VGAM GENE, encodes a VGAM3293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3293 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3293 precursor RNA is designated SEQ ID:74045, and is provided hereinbelow with reference to the sequence listing part.

[46063] VGAM3293 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46064] An enzyme complex designated DICER COMPLEX, dices

the VGAM3293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3293 RNA is designated SEQ ID:74046, and is provided hereinbelow with reference to the sequence listing part.

[46065] VGAM3293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3293 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46066] VGAM3293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3293 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3293 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46067] The complementary binding of VGAM3293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3293 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46068] It is appreciated that VGAM3293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3293 host target genes. The mRNA of each one of this plurality of VGAM3293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3293 RNA, herein designated VGAM RNA, and which when bound by VGAM3293 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3293 host target proteins.

[46069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3293 gene, herein designated VGAM GENE, on one or more VGAM3293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46070] It is yet further appreciated that a function of VGAM3293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3293 include diagnosis, prevention and treatment of viral infection by Broad bean mottle virus. Specific functions, and accordingly utilities, of VGAM3293 correlate with, and may be deduced from, the identity of the host target genes which VGAM3293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46071] Nucleotide sequences of the VGAM3293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3293 are further described hereinbelow with reference to Table 1.

[46072] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3293 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46073] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3294 (VGAM3294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46074] VGAM3294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3294 was detected is described hereinabove with reference to Figs. 2-8.

[46075] VGAM3294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine adenovirus B. VGAM3294 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[46076] VGAM3294 gene, herein designated VGAM GENE, encodes a VGAM3294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3294 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3294 precursor RNA is designated SEQ ID:74069, and is provided hereinbelow with reference to the sequence listing part.

[46077] VGAM3294 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46078] An enzyme complex designated DICER COMPLEX, dices the VGAM3294 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3294 RNA is designated SEQ ID:74070, and is provided hereinbelow with reference to the sequence listing part.

[46079] VGAM3294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3294 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46080] VGAM3294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3294 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3294 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46081] The complementary binding of VGAM3294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3294

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46082] It is appreciated that VGAM3294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3294 host target genes. The mRNA of each one of this plurality of VGAM3294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3294 RNA, herein designated VGAM RNA, and which when bound by VGAM3294 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3294 host target proteins.

[46083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3294 gene, herein designated VGAM GENE, on one or more VGAM3294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46084] It is yet further appreciated that a function of VGAM3294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3294 include diagnosis, prevention and treatment of viral infection by Bovine adenovirus B. Specific functions, and accordingly utilities, of VGAM3294 correlate with, and may be deduced from, the identity of the host target genes which VGAM3294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46085] Nucleotide sequences of the VGAM3294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3294 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3294 are further described hereinbelow with reference to Table 1.

[46086] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46087] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3295 (VGAM3295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46088] VGAM3295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3295 was detected is described hereinabove with reference to Figs. 2-8.

[46089] VGAM3295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM3295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[46090] VGAM3295 gene, herein designated VGAM GENE, encodes a VGAM3295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3295 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3295 precursor RNA is designated SEQ ID:74079, and is provided hereinbelow with reference to the sequence listing part.

[46091] VGAM3295 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46092] An enzyme complex designated DICER COMPLEX, dices the VGAM3295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3295 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3295 RNA is designated SEQ ID:74080, and is provided hereinbelow with reference to the sequence listing part.

[46093] VGAM3295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3295 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46094] VGAM3295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3295 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46095] The complementary binding of VGAM3295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3295 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46096] It is appreciated that VGAM3295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3295 host target genes. The mRNA of each one of this plurality of VGAM3295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3295 RNA, herein designated VGAM RNA, and which when bound by VGAM3295 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3295 host target proteins.

[46097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3295 gene, herein designated VGAM GENE, on one or more VGAM3295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46098] It is yet further appreciated that a function of VGAM3295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3295 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM3295 correlate with, and may be deduced from, the identity of the host target genes which VGAM3295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46099] Nucleotide sequences of the VGAM3295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3295 are further

described hereinbelow with reference to Table 1.

[46100] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46101] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3296 (VGAM3296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46102] VGAM3296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3296 was detected is described hereinabove with reference to Figs. 2-8.

[46103] VGAM3296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM3296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46104] VGAM3296 gene, herein designated VGAM GENE, encodes a VGAM3296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3296 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3296 precursor RNA is designated SEQ ID:74088, and is provided hereinbelow with reference to the sequence listing part.

[46105] VGAM3296 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46106] An enzyme complex designated DICER COMPLEX, dices the VGAM3296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3296 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3296 RNA is designated SEQ ID:74089, and is provided hereinbelow with reference to the sequence listing part.

[46107] VGAM3296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46108] VGAM3296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3296 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46109] The complementary binding of VGAM3296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3296 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3296 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46110] It is appreciated that VGAM3296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3296 host target genes. The mRNA of each one of this plurality of VGAM3296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3296 RNA, herein designated VGAM RNA, and which when bound by VGAM3296 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3296 host target proteins.

[46111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3296 gene, herein designated VGAM GENE, on one or more VGAM3296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46112] It is yet further appreciated that a function of VGAM3296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3296 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM3296 correlate with, and may be deduced from, the identity of the host target genes which VGAM3296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46113] Nucleotide sequences of the VGAM3296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3296 are further described hereinbelow with reference to Table 1.

[46114] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46115] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3297 (VGAM3297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46116] VGAM3297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3297 was detected is described hereinabove with reference to Figs. 2-8.

[46117] VGAM3297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46118] VGAM3297 gene, herein designated VGAM GENE, encodes

a VGAM3297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3297 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3297 precursor RNA is designated SEQ ID:74092, and is provided hereinbelow with reference to the sequence listing part.

[46119] VGAM3297 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46120] An enzyme complex designated DICER COMPLEX, dices the VGAM3297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3297 RNA is designated SEQ ID:74093, and is provided hereinbelow with reference to the sequence listing part.

[46121] VGAM3297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46122] VGAM3297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3297 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46123] The complementary binding of VGAM3297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3297 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[46124] It is appreciated that VGAM3297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3297 host target genes. The mRNA of each one of this plurality of VGAM3297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3297 RNA, herein designated VGAM RNA, and which when bound by VGAM3297 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3297 host target proteins.

[46125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3297 gene, herein designated VGAM GENE, on one or more VGAM3297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46126] It is yet further appreciated that a function of VGAM3297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3297 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3297 correlate with, and may be deduced from, the identity of the host target genes which VGAM3297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46127] Nucleotide sequences of the VGAM3297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3297 are further described hereinbelow with reference to Table 1.

[46128] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46129] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3298 (VGAM3298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46130] VGAM3298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3298 was detected is described hereinabove with reference to Figs. 2-8.

[46131] VGAM3298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46132] VGAM3298 gene, herein designated VGAM GENE, encodes a VGAM3298 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3298 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3298 precursor RNA is designated SEQ ID:74107, and is provided hereinbelow with reference to the sequence listing part.

[46133] VGAM3298 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46134] An enzyme complex designated DICER COMPLEX, dices the VGAM3298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3298 RNA is designated SEQ ID:74108, and is provided hereinbelow with reference to the sequence listing part.

[46135] VGAM3298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46136] VGAM3298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3298 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46137] The complementary binding of VGAM3298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3298 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46138] It is appreciated that VGAM3298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3298 host target genes. The mRNA of each one of this plurality of VGAM3298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3298 RNA, herein designated VGAM RNA, and which when bound by VGAM3298 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3298 host target proteins.

[46139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3298 gene, herein designated VGAM GENE, on one or more VGAM3298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46140] It is yet further appreciated that a function of VGAM3298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3298 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3298 correlate with, and may be deduced from, the identity of the host target genes which VGAM3298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46141] Nucleotide sequences of the VGAM3298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3298 are further described hereinbelow with reference to Table 1.

[46142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46143] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3299 (VGAM3299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46144] VGAM3299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3299 was detected is described hereinabove with reference to Figs. 2-8.

[46145] VGAM3299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46146] VGAM3299 gene, herein designated VGAM GENE, encodes a VGAM3299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3299 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3299 precursor RNA is designated SEQ ID:74115, and is provided hereinbelow with reference to the sequence listing part.

[46147] VGAM3299 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46148] An enzyme complex designated DICER COMPLEX, dices the VGAM3299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3299 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3299 RNA is designated SEQ ID:74116, and is provided hereinbelow with reference to the sequence listing part.

[46149] VGAM3299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46150] VGAM3299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3299 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46151] The complementary binding of VGAM3299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3299 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46152] It is appreciated that VGAM3299 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3299 host target genes. The mRNA of each one of this plurality of VGAM3299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3299 RNA, herein designated VGAM RNA, and which when bound by VGAM3299 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3299 host target proteins.

[46153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3299 gene, herein designated VGAM GENE, on one or more VGAM3299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46154] It is yet further appreciated that a function of VGAM3299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3299 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3299 correlate with, and may be deduced from, the identity of the host target genes which VGAM3299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46155] Nucleotide sequences of the VGAM3299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3299 are further described hereinbelow with reference to Table 1.

[46156] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46157] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3300 (VGAM3300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46158] VGAM3300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3300 was detected is described hereinabove with reference to Figs. 2–8.

[46159] VGAM3300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse parvovirus 1. VGAM3300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46160] VGAM3300 gene, herein designated VGAM GENE, encodes a VGAM3300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3300 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3300 precursor RNA is designated SEQ ID:74124, and is provided hereinbelow with reference to the sequence listing part.

[46161] VGAM3300 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46162] An enzyme complex designated DICER COMPLEX, dices the VGAM3300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3300 RNA is designated SEQ ID:74125, and is provided hereinbelow with reference to the sequence listing part.

[46163] VGAM3300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46164] VGAM3300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3300 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46165] The complementary binding of VGAM3300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3300 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46166] It is appreciated that VGAM3300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3300 host target genes. The mRNA of each one of this plurality of VGAM3300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3300 RNA, herein designated VGAM RNA, and which when bound by VGAM3300 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3300 host target proteins.

[46167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3300 gene, herein designated VGAM GENE, on one or more VGAM3300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [46168] It is yet further appreciated that a function of VGAM3300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3300 include diagnosis, prevention and treatment of viral infection by Mouse parvovirus 1. Specific functions, and accordingly utilities, of VGAM3300 correlate with, and may be deduced from, the identity of the host target genes which VGAM3300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [46169] Nucleotide sequences of the VGAM3300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3300 are further described hereinbelow with reference to Table 1.
- [46170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46171] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3301 (VGAM3301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46172] VGAM3301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3301 was detected is described hereinabove with reference to Figs. 2-8.

[46173] VGAM3301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46174] VGAM3301 gene, herein designated VGAM GENE, encodes a VGAM3301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3301 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3301 precursor RNA is designated SEQ ID:74153, and is provided hereinbelow with reference to the sequence listing part.

[46175] VGAM3301 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46176] An enzyme complex designated DICER COMPLEX, dices the VGAM3301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3301 RNA is designated SEQ ID:74154, and is provided hereinbelow with reference to the sequence listing part.

[46177] VGAM3301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46178] VGAM3301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3301 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46179] The complementary binding of VGAM3301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3301 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46180] It is appreciated that VGAM3301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3301 host target genes. The mRNA of

each one of this plurality of VGAM3301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3301 RNA, herein designated VGAM RNA, and which when bound by VGAM3301 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3301 host target proteins.

[46181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3301 gene, herein designated VGAM GENE, on one or more VGAM3301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[46182] It is yet further appreciated that a function of VGAM3301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3301 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3301 correlate with, and may be deduced from, the identity of the host target genes which VGAM3301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46183] Nucleotide sequences of the VGAM3301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3301 are further described hereinbelow with reference to Table 1.

[46184] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3301 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.
